Image Management Service

API Reference

Date   **2023-02-13**

Contents

1 Before You Start

1.1 Overview

Welcome to *Image Management Service API Reference*. An image is a template used to create a server or disk. Image Management Service (IMS) provides image lifecycle management. You can use a server or an external image file to create a system or data disk image, or use an Elastic Cloud Server (ECS) or Cloud Backup and Recovery (CBR) backup to create a full-ECS image.

This document describes how to use application programming interfaces (APIs) to perform operations on images, such as creating, querying, deleting and updating images. For details about all supported operations, see **API Overview**.

If you plan to access IMS through an API, ensure that you are familiar with IMS concepts. For details, see section "Overview" in *Image Management Service User Guide*.

1.2 API Calling

IMS supports Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see **Calling APIs**.

1.3 Endpoints

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. For the endpoints of all services, see **Regions and Endpoints**.

1.4 Constraints

- The number of images that you can create is determined by your quota. To view or increase the quota, see section "How Do I Increase the Image Quota?" in *Image Management Service User Guide*.
- For more constraints, see API description.

1.5 Concepts

- Account

  An account is created upon successful registration. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity, which should not be used directly to perform routine management. For security purposes, create Identity and Access Management (IAM) users and grant them permissions for routine management.

- User

  An IAM user is created by an account in IAM to use cloud services. Each IAM user has its own identity credentials (password and access keys).

  API authentication requires information such as the account name, username, and password.

- Region

  A region is a geographic area in which cloud resources are deployed. Availability zones (AZs) in the same region can communicate with each other over an intranet, while AZs in different regions are isolated from each other. Deploying cloud resources in different regions can better suit certain user requirements or comply with local laws or regulations.
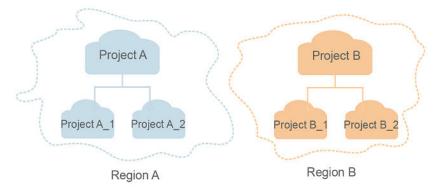

- AZ

  An AZ comprises of one or more physical data centers equipped with independent ventilation, fire, water, and electricity facilities. Computing, network, storage, and other resources in an AZ are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to allow you to build cross-AZ high-availability systems.

- Project

  A project corresponds to a region. Default projects are defined to group and physically isolate resources (including computing, storage, and network resources) across regions. Users can be granted permissions in a default project to access all resources under their accounts in the region associated with the project. If you need more refined access control, create subprojects under a default project and create resources in subprojects. Then you can assign users the permissions required to access only the resources in the specific subprojects.

  Figure 1-1 Project isolation model

1.6 Selecting an API Type

The following APIs have been abandoned and are not recommended:

- **Deleting an Image (Native OpenStack API v1.1 - Abandoned and Not Recommended)**
- **Querying Image Metadata (Native OpenStack API v1 - Abandoned and Not Recommended)**
- **Querying Image Details (Native OpenStack API v1.1 - Abandoned and Not Recommended)**

2 API Overview

IMS APIs include native OpenStack APIs and extension APIs.

A combination of the two types of APIs allows you to use all functions provided by IMS. For example, you can use either native OpenStack APIs or extension APIs to create private images.

Table 2-1 API description

Type	Subtype	Description
IMS APIs	Image	Create, query, and export images.
	Image sharing	Share private images with other tenants.
	Image replication	Replicate an existing image as another one. When replicating an image, you can change the image attributes to meet the requirements of different scenarios.
	Image quota	Query the number of private images in the current region.
	Image jobs	Query the execution status of an asynchronous job.
Native OpenStack API	Image	Create, query, and export images.
	Image schema	An image schema is used to display details of an images or image entity, such as the entity's attributes and their data types. With an image schema, you can understand basic information about an image.
	Image sharing	Share private images with other tenants.

3 Calling APIs

3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for obtaining a user token as an example to demonstrate how to call an API. The obtained token can then be used to authenticate the calling of other APIs.

Request URI

A request URI is in the following format:

{URI-scheme}://{Endpoint}/{resource-path}?{query-string}

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be transmitted separately.

Table 3-1 URI parameter description

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service. The endpoint varies between services in different regions. It can be obtained from **Regions and Endpoints**.
	For example, the endpoint of IAM in the **ru-moscow-1** region is **iam.ru-moscow-1.hc.sbercloud.ru**.
resource-path	Access path of an API for performing a specified operation. Obtain the path from the URI of an API. For example, the **resource-path** of the API used to obtain a user token is **/v3/auth/tokens**.

Parameter	Description
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of *Parameter name=Parameter value*. For example, **? limit=10** indicates that a maximum of 10 data records will be displayed.

☐ NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server.

Table 3-2 HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Same as GET except that the server must return only the response header.
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

For example, in the case of the API used to obtain a user token, the request method is **POST**. The request is as follows:

POST https://iam.ru-moscow-1.hc.sbercloud.ru/v3/auth/tokens

Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Common request header fields are as follows.

Table 3-3 Common request header fields

Parameter	Description	Mandatory	Example Value
Host	Specifies the server domain name and port number of the resources being requested. The value can be obtained from the URL of the service API. The value is in the format of *Hostname:Port number*. If the port number is not specified, the default port is used. The default port number for **https** is **443**.	No This field is mandatory for AK/SK authentication.	code.test.com or code.test.com:443
Content-Type	Specifies the type (or format) of the message body. The default value **application/json** is recommended. Other values of this field will be provided for specific APIs if any.	Yes	application/json
Content-Length	Specifies the length of the request body. The unit is byte.	No	3495
X-Project-Id	Specifies the project ID. Obtain the project ID by following the instructions in **Obtaining a Project ID**.	No	e9993fc787d94b6c886cbaa340f9c0f4
X-Auth-Token	Specifies the user token. It is a response to the API for obtaining a user token (This is the only API that does not require authentication). After the request is processed, the value of **X-Subject-Token** in the response header is the token value.	No This field is mandatory for token authentication.	The following is part of an example token: MIIPAgYJKoZIhvcNAQcCo...ggg1BBIINPXsidG9rZ

📖 **NOTE**

> In addition to supporting authentication using tokens, APIs support authentication using AK/SK, which uses SDKs to sign a request. During the signature, the **Authorization** (signature authentication) and **X-Sdk-Date** (time when a request is sent) headers are automatically added in the request.
>
> For more details, see "Authentication Using AK/SK" in **Authentication**.

The API used to obtain a user token does not require authentication. Therefore, only the **Content-Type** field needs to be added to requests for calling the API. An example of such requests is as follows:

```
POST https://iam.ru-moscow-1.hc.sbercloud.ru/v3/auth/tokens
Content-Type: application/json
```

(Optional) Request Body

This part is optional. The body of a request is often sent in a structured format as specified in the **Content-Type** header field. The request body transfers content except the request header.

The request body varies between APIs. Some APIs do not require the request body, such as the APIs requested using the GET and DELETE methods.

In the case of the API used to obtain a user token, the request parameters and parameter description can be obtained from the API request. The following provides an example request with a body included. Replace *username*, *domainname*, ********** (login password), and *xxxxxxxxxxxxxxxx* (project name) with the actual values. Obtain a project name from **Regions and Endpoints**.

📖 **NOTE**

> The **scope** parameter specifies where a token takes effect. You can set **scope** to an account or a project under an account. In the following example, the token takes effect only for the resources in a specified project. For more information about this API, see "Obtaining a User Token".

```
POST https://iam.ru-moscow-1.hc.sbercloud.ru/v3/auth/tokens
Content-Type: application/json

{
    "auth": {
        "identity": {
            "methods": [
                "password"
            ],
            "password": {
                "user": {
                    "name": "username",
                    "password": "********",
                    "domain": {
                        "name": "domainname"
                    }
                }
            }
        },
        "scope": {
            "project": {
                "name": "xxxxxxxxxxxxxxxx"
            }
        }
    }
}
```

If all data required for the API request is available, you can send the request to call the API through **curl**, **Postman**, or coding. In the response to the API used to obtain a user token, **x-subject-token** is the desired user token. This token can then be used to authenticate the calling of other APIs.

3.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token authentication: Requests are authenticated using tokens.

- AK/SK authentication: Requests are encrypted using AK/SK pairs. AK/SK authentication is recommended because it is more secure than token authentication.

Token Authentication

> **NOTE**
>
> The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to requests to get permissions for calling the API. You can obtain a token by calling the Obtaining User Token API.

A cloud service can be deployed as either a project-level service or global service.

- For a project-level service, you need to obtain a project-level token. When you call the API, set **auth.scope** in the request body to **project**.

- For a global service, you need to obtain a global token. When you call the API, set **auth.scope** in the request body to **domain**.

IMS is a project-level service. When you call the API, set **auth.scope** in the request body to **project**.

```
{
   "auth": {
      "identity": {
         "methods": [
            "password"
         ],
         "password": {
            "user": {
               "name": "username",
               "password": "********",
               "domain": {
                  "name": "domainname"
               }
            }
         }
      },
      "scope": {
         "project": {
            "name": "xxxxxxxx"
         }
      }
   }
}
```

After a token is obtained, the **X-Auth-Token** header field must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, **X-Auth-Token: ABCDEFJ....** can be added to a request as follows:

```
POST https://iam.ru-moscow-1.hc.sbercloud.ru/v3/auth/projects
Content-Type: application/json
X-Auth-Token: ABCDEFJ....
```

AK/SK Authentication

📖 **NOTE**

AK/SK authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token authentication is recommended.

In AK/SK authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.

- SK: secret access key, which is used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK authentication, you can use an AK/SK to sign requests based on the signature algorithm or using the signing SDK. For details about how to sign requests and use the signing SDK, see **API Request Signing Guide**.

📖 **NOTE**

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

3.3 Response

Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see **Status Codes**.

For example, if status code **201** is returned for calling the API used to obtain a user token, the request is successful.

Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

Figure 3-1 shows the response header fields for the API used to obtain a user token. The **x-subject-token** header field is the desired user token. This token can then be used to authenticate the calling of other APIs.

Figure 3-1 Header fields of the response to the request for obtaining a user token

connection → keep-alive

content-type → application/json

date → Tue, 12 Feb 2019 06:52:13 GMT

server → Web Server

strict-transport-security → max-age=31536000; includeSubdomains;

transfer-encoding → chunked

via → proxy A

x-content-type-options → nosniff

x-download-options → noopen

x-frame-options → SAMEORIGIN

x-iam-trace-id → 218d45ab-d674-4995-af3a-2d0255ba41b5

x-subject-token

x-xss-protection → 1; mode=block;

(Optional) Response Body

The body of a response is often returned in structured format as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following is part of the response body for the API used to obtain a user token.

```
{
    "token": {
        "expires_at": "2019-02-13T06:52:13.855000Z",
        "methods": [
            "password"
        ],
        "catalog": [
            {
                "endpoints": [
                    {
                        "region_id": "az-01",
......
```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{
    "error_msg": "The format of message is error",
    "error_code": "AS.0001"
}
```

In the response body, **error_code** is an error code, and **error_msg** provides information about the error.

4 Getting Started

This section describes how to make API calls to create a private image from an ECS.

For details about how to call APIs, see **Calling APIs**.

📖 **NOTE**

- Before using an ECS to create a private image, ensure that the ECS is stopped.
- The token obtained from IAM is valid for only 24 hours. If you want to use a token for authentication, you can cache it to avoid frequently calling the IAM API.

Involved APIs

If you use a token for authentication, you must obtain the token and add **X-Auth-Token** to the request header of the IMS API when making an API call.

- IAM API used to obtain the token
- IMS API used to create a private image

Procedure

1. Obtain the token by referring to **Authentication**.
2. Send **POST https://IMS endpoint/v2/cloudimages/action**.
3. Add **X-Auth-Token** to the request header.
4. Specify the following parameters in the request body:

```
{
    "name": "ims_test",  //Image name (a mandatory string)
    "description": "Image creation from an ECS",  //Image description (an optional string)
    "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",  //ECS ID (a mandatory string)
    "tags": [
            "aaa.111",
            "bbb.333",
            "ccc.444"
    ] //Image tag list (optional, List<String>)
}
```

If the request is successful, a job ID is returned.

If the request fails, an error code and error information are returned. For details, see **Error Codes**.

5. Query job details using the job ID by referring to **Asynchronous Job Query**.

   If the job status is **SUCCESS**, the private image is successfully created.

   For details about status codes for request exceptions, see **Status Codes**.

6. Obtain the image ID from the body of the job and query, delete, and export the private image using the image ID.

<div align="right">

5 IMS APIs

</div>

5.1 Image

5.1.1 Querying Images

Function

This API is used to query images using search criteria and to display the images in a list.

URI

GET /v2/cloudimages{?
__isregistered,__imagetype,__whole_image,protected,visibility,owner,id,status,name
,container_format,disk_format,min_ram,min_disk,__os_bit,__platform,marker,limit,s
ort_key,sort_dir,__os_type,tag,member_status,__support_kvm,__support_xen,__supp
ort_largememory,__support_diskintensive,__support_highperformance,__support_xe
n_gpu_type,__support_kvm_gpu_type,__support_xen_hana,__support_kvm_infiniban
d,virtual_env_type,created_at,updated_at}

📖 **NOTE**

You can type a question mark (?) and an ampersand (&) at the end of the URI to define multiple search criteria. For details, see the example request.

Table 5-1 Parameter description

Parameter	Mandatory	Type	Description
__isregistered	No	String	Specifies whether the image is available. The value can be **true**. The value is **true** for all extension APIs by default. Common users can query only the images for which the value of this parameter is **true**.
__imagetype	No	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**. **NOTE** The __**imagetype** of images you share with other tenants or those other tenants share with you and you have accepted is **shared**. You can use field **owner** to distinguish the two types of shared images. You can use **member_status** to filter out shared images you have accepted.
__whole_image	No	Boolean	Specifies whether the image is a full-ECS image. The value can be **true** or **false**.
__system_cmkid	No	String	Specifies the ID of the key used to encrypt the image. You can obtain the ID from the IMS console or by calling the **Querying Image Details (Native OpenStack API)** API.
protected	No	Boolean	Specifies whether the image is protected. The value can be **true** or **false**. Set it to **true** when you query public images. This parameter is optional when you query private images.
visibility	No	String	Specifies whether the image is available to other tenants. Available values include: ● **public**: public image ● **private**: private image ● **shared**: shared image
owner	No	String	Specifies the tenant to which the image belongs.
id	No	String	Specifies the image ID.

Parameter	Mandatory	Type	Description
status	No	String	Specifies the image status. The value can be one of the following: • **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. • **saving**: indicates that the image file is being uploaded to the backend storage. • **deleted**: indicates that the image has been deleted. • **killed**: indicates that an error occurs on the image uploading. • **active**: indicates that the image is available for use.
name	No	String	Specifies the image name. Exact matching is used. For detailed description, see **Image Attributes**.
container_format	No	String	Specifies the container type. The value is **bare**.
disk_format	No	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is **0**.
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.
__os_bit	No	String	Specifies the OS architecture, 32 bit or 64 bit.
__platform	No	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
marker	No	String	Specifies the start number from which images are queried. The value is the image ID.

Paramete r	Mandato ry	Type	Description
limit	No	Integer	Specifies the number of images to be queried. The value is an integer and is **500** by default.
sort_key	No	String	Specifies the field for sorting the query results. The value can be an attribute of the image: **name**, **container_format**, **disk_format**, **status**, **id**, **size**, or **created_at**. The default value is **created_at**.
sort_dir	No	String	Specifies whether the query results are sorted in ascending or descending order. Its value can be **desc** (default) or **asc**. This parameter is used together with parameter **sort_key**. The default value is **desc**.
__os_type	No	String	Specifies the image OS type. Available values include: ● Linux ● Windows ● Other
tag	No	String	Specifies a tag added to an image. Tags can be used as a filter to query images. **NOTE** The tagging function has been upgraded. If the tags added before the function upgrade are in the format of "Key.Value", query tags using "Key=Value". For example, an existing tag is **a.b**. After the tag function upgrade, query the tag using "tag=a=b".
member_s tatus	No	String	Specifies the member status. The value can be **accepted**, **rejected**, or **pending**. **accepted**: indicates that the shared image is accepted. **rejected** indicates that the image shared by others is rejected. **pending** indicates that the image shared by others needs to be confirmed. To use this parameter, set **visibility** to **shared** during the query.
__support_ kvm	No	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_ xen	No	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.

Parameter	Mandatory	Type	Description
__support_largememory	No	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required. For the supported OSs, see **Table 9-4**.
__support_diskintensive	No	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_highperformance	No	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_xen_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See **Table 9-2** for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with **__support_xen** and **__support_kvm**.
__support_kvm_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with **__support_xen** and **__support_kvm**.
__support_xen_hana	No	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with **__support_xen** and **__support_kvm**.
__support_kvm_infiniband	No	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with **__support_xen**.

Paramete r	Mandato ry	Type	Description
virtual_en v_type	No	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. ● For an ECS image (system disk image), the value is **FusionCompute**. ● For a data disk image, the value is **DataImage**. ● For a BMS image, the value is **Ironic**. ● For an ISO image, the value is **IsoImage**.
created_at	No	String	Specifies the time when the image was created. Images can be queried by time. The value is in the format of *Operator:UTC time*. The following operators are supported: ● gt: greater than ● gte: greater than or equal to ● lt: less than ● lte: less than or equal to ● eq: equal to ● neq: not equal to The time format is *yyyy-MM-ddThh:mm:ssZ* or *yyyy-MM-dd hh:mm:ss*. For example, to query images created before Oct 28, 2018 10:00:00, set the value of **created_at** as follows: created_at=lt:2018-10-28T10:00:00Z

Paramete r	Mandato ry	Type	Description
updated_a t	No	String	Specifies the time when the image was modified. Images can be queried by time. The value is in the format of *Operator:UTC time*. The following operators are supported: ● gt: greater than ● gte: greater than or equal to ● lt: less than ● lte: less than or equal to ● eq: equal to ● neq: not equal to The time format is *yyyy-MM-ddThh:mm:ssZ* or *yyyy-MM-dd hh:mm:ss*. For example, to query images updated before Oct 28, 2018 10:00:00, set the value of **updated_at** as follows: updated_at=lt:2018-10-28T10:00:00Z

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2/cloudimages?__imagetype=gold&sort_key=name&limit=1

Common Query Methods

- Public images

  GET /v2/cloudimages?__imagetype=gold&visibility=public&protected=true

- Private images

  GET /v2/cloudimages?owner={project_id}

- Available shared images

  GET /v2/cloudimages?member_status=accepted&visibility=shared&__imagetype=shared

- Rejected images

  GET /v2/cloudimages?member_status=rejected&visibility=shared&__imagetype=shared

- Unaccepted images

  GET /v2/cloudimages?member_status=pending&visibility=shared&__imagetype=shared

Response

- Response parameters

Parameter	Type	Description
images	Array of objects	Specifies image details. For details, see **Table 5-2**.

Table 5-2 Data structure description of the images field

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.
status	String	Specifies the image status. The value can be one of the following: - **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. - **saving**: indicates that the image file is being uploaded to the backend storage. - **deleted**: indicates that the image has been deleted. - **killed**: indicates that an error occurs on the image uploading. - **active**: indicates that the image is available for use.

Parameter	Type	Description
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.
visibility	String	Specifies whether the image is available to other tenants. Available values include: ● **private**: private image ● **public**: public image ● **shared**: shared image
name	String	Specifies the image name. For detailed description, see **Image Attributes**.
checksum	String	This parameter is unavailable currently.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be **true** or **false**.
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is **0**.
max_ram	String	Specifies the maximum memory (MB) of the image. You can set this parameter based on the ECS specifications. Generally, you do not need to set this parameter.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.

Parameter	Type	Description
__description	String	Specifies the image description. For detailed description, see **Image Attributes**.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be **true** or **false**.
__platform	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
__os_type	String	Specifies the OS type. The value can be **Linux**, **Windows**, or **Other**.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. • For an ECS image, the value is **FusionCompute**. • For a data disk image, the value is **DataImage**. • For a BMS image, the value is **Ironic**. • For an ISO image, the value is **IsoImage**.
__image_source_type	String	Specifies the image backend storage type. Only UDS is supported currently.

Parameter	Type	Description
__imagetype	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. To create an image using a backup, set the value to the backup ID. Otherwise, this value is left empty.
__image_size	String	Specifies the size (bytes) of the image file.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be **true**, **false**, **True**, or **False**.
active_at	String	Specifies the time when the image status became **active**.
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.

Parameter	Type	Description
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See **Table 9-2** for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with **__support_xen** and **__support_kvm**.

Parameter	Type	Description
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with **__support_xen** and **__support_kvm**.
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with **__support_xen** and **__support_kvm**.
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with **__support_xen**.
__root_origin	String	Specifies that the image is created from an external image file. Value: **file**
__sequence_num	String	Specifies the ECS system disk slot number corresponding to the image. Example value: **0**
__support_fc_inject	String	Specifies whether the image supports password/private key injection using Cloud-Init. If the value is set to **true**, password/private key injection using Cloud-Init is not supported. **NOTE** This parameter is valid only for ECS system disk images.

Parameter	Type	Description
hw_firmware_type	String	Specifies the ECS boot mode. Available values include: • **bios** indicates the BIOS boot mode. • **uefi** indicates the UEFI boot mode.
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be **true** or **false**.
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be **true** or **false**.

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.2 Updating Image Information

Function

This API is used to modify image attributes and update image information.

📖 NOTE

Only information of images in **active** status can be changed.

URI

PATCH /v2/cloudimages/{image_id}

Table 5-3 describes the parameters in the URI.

Table 5-3 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Private image ID For details about how to obtain the image ID, see **Querying Images**.

Request

- Request parameters

Parameter	Mandatory	Type	Description
[Array]	Yes	Array of objects	For details, see **Table 5-4**.

Table 5-4 Data structure description of the [Array] field

Parameter	Mandatory	Type	Description
op	Yes	String	Specifies the operation. The value can be **add**, **replace**, or **remove**.

Parameter	Mandatory	Type	Description
path	Yes	String	Specifies the name of the attribute to be modified. **/** needs to be added in front of it. You can modify the following attributes: • **name**: specifies the image name. • **__description**: specifies the image description. • **__support_kvm**: KVM is supported. • **__support_xen**: Xen is supported. • **__support_diskintensive**: Intensive storage is supported. • **__support_highperformanc e**: High-performance computing (HPC) is supported. • **__support_xen_gpu_type**: GPU-accelerated ECSs that use Xen for virtualization are supported. • **__support_kvm_gpu_type**: GPU-accelerated ECSs that use KVM for virtualization are supported. • **__is_config_init**: specifies whether initialization configuration is complete. • **min_ram**: specifies the minimum memory. • **hw_vif_multiqueue_enable d**: The NIC multi-queue feature is supported. • **hw_firmware_type**: specifies the boot mode. The value can be **bios** or **uefi**. You can add or delete extension attributes.

Parameter	Mandatory	Type	Description
value	Yes	String	Specifies the new value of the attribute. For detailed description, see **Image Attributes**.

- Example request

```
PATCH https://{Endpoint}/v2/cloudimages/33ad552d-1149-471c-8190-ff6776174a00
[
  {
    "op": "replace",
    "path": "/name",
    "value": "ims_test"
  }
]
```

Response

- Response parameters

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.
status	String	Specifies the image status. The value can be one of the following: • **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. • **saving**: indicates that the image file is being uploaded to the backend storage. • **deleted**: indicates that the image has been deleted. • **killed**: indicates that an error occurs on the image uploading. • **active**: indicates that the image is available for use.

Parameter	Type	Description
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.
visibility	String	Specifies whether the image is available to other tenants. The value can be one of the following: • **private**: private image • **public**: public image • **shared**: shared image
name	String	Specifies the image name. For detailed description, see **Image Attributes**.
checksum	String	This parameter is unavailable currently.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be **true** or **false**.
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. The default value is **0**.
max_ram	String	Specifies the maximum memory (MB) of the image. The parameter value depends on the ECS specifications and is not configured by default.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be **true** or **false**.

Parameter	Type	Description
__platform	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
__os_type	String	Specifies the OS type. The value can be **Linux**, **Windows**, or **Other**.
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. ● For an ECS image (system disk image), the value is **FusionCompute**. ● For a data disk image, the value is **DataImage**. ● For a BMS image, the value is **Ironic**. ● For an ISO image, the value is **IsoImage**.
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.
__imagetype	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. If the image is created from a backup, set the value to the backup ID. Otherwise, this parameter is not required.

Parameter	Type	Description
__image_size	String	Specifies the size (bytes) of the image file. The value must be greater than **0**.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
__root_origin	String	Specifies that the image is created from an external image file. Value: **file**
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be **true**, **false**, **True**, or **False**.
active_at	String	Specifies the time when the image status became **active**.
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__account_code	String	Specifies the charging identifier for the image.
hw_firmware_type	String	Specifies the ECS boot mode. The following values are supported: ● **bios** indicates the BIOS boot mode. This value will be used by fault if this parameter does not exist in the response. ● **uefi** indicates the UEFI boot mode.
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be **true** or **false**.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image can be used to create large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required. For the supported OSs, see **Table 9-4**.

Parameter	Type	Description
__support_diskintensive	String	Specifies whether the image can be used to create disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image can be used to create high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See **Table 9-2** for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen**.
__sequence_num	String	Specifies the ECS system disk slot number corresponding to the image. This parameter is unavailable currently.

Parameter	Type	Description
__support_fc_inject	String	Specifies whether the image supports password/private key injection using Cloud-Init. If the value is set to **true**, password/private key injection using Cloud-Init is not supported. **NOTE** This parameter is valid only for ECS system disk images.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be **true** or **false**.

Returned Values

- Normal
200

● Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.3 Creating an Image

Function

This API is used to create a private image. The following methods are supported:

● Create a system or data disk image from an ECS.

● Create a system disk image from an external image file uploaded to an OBS bucket.

● Create a system disk image from a data disk.

The API is an asynchronous one. If it is successfully called, the cloud service system receives the request. However, you need to use the asynchronous job query API to query the image creation status. For details, see **Asynchronous Job Query**.

Constraints (Creating a System Disk Image Using a Data Disk)

● Before using a data disk to create a system disk image, ensure that an OS has been installed on the data disk and has been optimized. For details about the optimization, see "Optimizing a Windows Private Image" and "Optimizing a Linux Private Image" in the *Image Management Service User Guide*.

● The system cannot verify that an OS has been installed on the data disk. Therefore, ensure that the value of **os_version** is valid when creating a system disk image from the data disk. For details, see **Values of Related Parameters**.

URI

POST /v2/cloudimages/action

Request

● Parameters for creating a system or data disk image from an ECS

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the name of the system disk image. For detailed description, see **Image Attributes**.
description	No	String	Specifies the image description. For details, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
instance_id	Yes	String	Specifies the ID of the ECS used to create the image. To obtain the ECS ID, perform the following operations: 1. Log in to management console. 2. Under **Computing**, click **Elastic Cloud Server**. 3. In the ECS list, click the name of the ECS and view its ID.
data_images	No	Array of objects	Specifies the data disk information to be converted. This parameter is mandatory when the data disk of an ECS is used to create a private data disk image. For details, see **Table 5-5**. If the ECS data disk is not used to create a data disk image, the parameter is empty by default. **NOTE** When you create a data disk image using a data disk, if other parameters (such as **name**, **description**, and **tags**) in this table have values, the system uses the value of **data_images**. You cannot specify **instance_id**.

Parameter	Mandatory	Type	Description
tags	No	Array of strings	Specifies tags of the image. This parameter is left blank by default. Use either **tags** or **image_tags**.
image_tags	No	Array of objects	Specifies tags of the image. This parameter is left blank by default. Use either **tags** or **image_tags**.
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB.
min_ram	No	Integer	Specifies the minimum memory of the image in the unit of MB. The default value is **0**, indicating that the memory is not restricted.

Table 5-5 Data structure description of the data_images field

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the name of a data disk image.
volume_id	Yes	String	Specifies the data disk ID.
description	No	String	Specifies the data disk description.
tags	No	Array of strings	Specifies the data disk image tag.

● Parameters for creating an image using an image file uploaded to the OBS bucket

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.

Parameter	Mandatory	Type	Description
description	No	String	Specifies the image description. For detailed description, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
os_type	No	String	Specifies the OS type. The value can be **Linux**, **Windows**, or **Other**.
os_version	No	String	Specifies the OS version. This parameter is valid if an external image file uploaded to the OBS bucket is used to create an image. For its value, see **Values of Related Parameters**. **NOTE** If the uploaded file is in ISO format, this parameter is mandatory. This parameter is mandatory when the value of **is_quick_import** is **true**, that is, a system disk image is imported using the quick import method.

Parameter	Mandatory	Type	Description

image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket.
			
			This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The format is *OBS bucket name:Image file name*.
			
			● To obtain an OBS bucket name:
			
			  1. Log in to the management console and choose **Storage** > **Object Storage Service**. All OBS buckets are displayed in the list.
			
			  2. Filter the OBS buckets by region and locate the target bucket in the current region.
			
			● To obtain an OBS image file name:
			
			  1. Log in to the management console and choose **Storage** > **Object Storage Service**. All OBS buckets are displayed in the list.
			
			  2. Filter the OBS buckets by region and locate the target bucket in the current region.
			
			  3. Click the name of the target bucket to go to the bucket details page.
			
			  4. In the navigation pane on the left, choose **Objects** to display objects in the OBS bucket and then locate the external image file used to create an image.
			
			NOTE
			The storage class of the OBS bucket must be **Standard**.

Parameter	Mandatory	Type	Description
min_disk	Yes	Integer	Specifies the minimum size of the system disk in the unit of GB. This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The value ranges from 40 GB to 255 GB.
is_config	No	Boolean	Specifies whether automatic configuration is enabled. The value can be **true** or **false**. If automatic configuration is required, set the value to **true**. Otherwise, set the value to **false** The default value is **false**. For details about automatic configuration, see **Creating a Linux System Disk Image from an External Image File** > **Registering an External Image File as a Private Image (Linux)** in *Image Management Service User Guide*.
cmk_id	No	String	Specifies the master key used for encrypting an image. For its value, see the *Key Management Service User Guide*.
tags	No	Array of strings	Specifies tags of the image. The value is left blank by default. Use either **tags** or **image_tags**.
image_tags	No	Array of objects	Specifies tags of the image. This parameter is left blank by default. Use either **tags** or **image_tags**.
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB.

Parameter	Mandatory	Type	Description
min_ram	No	Integer	Specifies the minimum memory required by the image in the unit of MB. The default value is **0**, indicating that the memory is not restricted.
data_images	No	Array of objects	Specifies the data disk information to be imported. An external image file can contain a maximum of three data disks. In this case, one system disk and three data disks will be created. For details, see **Table 5-6**. **NOTE** ● If a data disk image file is used to create a data disk image, the OS type of the data disk image must be the same as that of the system disk image. ● If other parameters (such as **name**, **description**, and **tags**) in **Table 5-6** are set, the system uses the values in **data_images**.
is_quick_import	No	Boolean	Specifies whether to use the quick import method to import a system disk image. ● If yes, set the value to **true**. ● If no, set the value to **false**. For details about the restrictions on quick import of image files, see **Importing an Image File Quickly**.

Table 5-6 Data structure description of the images field

Parameter	Mandatory	Type	Description
name	No	String	Specifies the image name. For more details, see **Image Attributes**.

Parameter	Manda tory	Type	Description
description	No	String	Specifies the image description. The value is left blank by default. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. For more details, see **Image Attributes**.

image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket. The format is *OBS bucket name:Image file name*.
			● To obtain an OBS bucket name:
			  1. Log in to the management console and choose **Storage** > **Object Storage Service**. All OBS buckets are displayed in the list.
			  2. Filter the OBS buckets by region and locate the target bucket in the current region.
			● To obtain an OBS image file name:
			  1. Log in to the management console and choose **Storage** > **Object Storage Service**. All OBS buckets are displayed in the list.
			  2. Filter the OBS buckets by region and locate the target bucket in the current region.
			  3. Click the name of the target bucket to go to the bucket details page.
			  4. In the navigation pane on the left, choose **Objects** to display objects in the OBS bucket and then locate the external image file used to create an image.
			NOTE
			  The storage class of the OBS bucket must be **Standard**.

Parameter	Mandatory	Type	Description
min_disk	Yes	Integer	Specifies the minimum size of the data disk. Unit: GB Value range: 1–2048
is_quick_import	No	Boolean	Specifies whether an image file is imported quickly to create a data disk image. ● If yes, set the value to **true**. ● If no, set the value to **false**. For details about the restrictions on quick import of image files, see **Importing an Image File Quickly**.
tags	No	Array of strings	Specifies tags of the image. The value is left blank by default. For detailed parameter descriptions, see **Image Tag Data Formats**. Use either **tags** or **image_tags**.
image_tags	No	Array of objects	Specifies tags of the image. The value is left blank by default. For detailed parameter descriptions, see **Image Tag Data Formats**. Use either **tags** or **image_tags**.

● Parameters for creating a system disk image using a data disk

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the name of the system disk image. For more details, see **Image Attributes**.
volume_id	Yes	String	Specifies the data disk ID.

Parameter	Mandatory	Type	Description
os_version	Yes	String	Specifies the OS version.
			Set the parameter value based on **Values of Related Parameters**. Otherwise, the created system disk image may be unavailable.
			During the creation of a system disk image, if the OS can be detected from the data disk, the OS version in the data disk is used. In this case, the **os_version** value is invalid. If the OS can be detected from the data disk, the **os_version** value is used.
type	No	Sting	Specifies the image type.
			The value can be **ECS**, **BMS**, **FusionCompute**, or **Ironic**.
			● **ECS** and **FusionCompute**: indicates an ECS image.
			● **BMS** and **Ironic**: indicates a BMS image.
			The default value is **ECS**.
description	No	String	Specifies the image description. This parameter is left blank by default. For details, see **Image Attributes**.
			The image description must meet the following requirements:
			● Contains only letters and digits.
			● Cannot contain carriage returns and angle brackets (< >).
			● Cannot exceed 1024 characters.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image.
			The parameter value depends on the ECS specifications. The default value is **0**.
max_ram	No	Integer	Specifies the maximum memory size (MB) required for running the image.
			The parameter value depends on the ECS specifications. The default value is **0**.

Parameter	Mandatory	Type	Description
tags	No	Array of strings	Specifies tags of the image. This parameter is left blank by default. Use either **tags** or **image_tags**.
image_tags	No	Array of objects	Specifies tags of the image. This parameter is left blank by default. Use either **tags** or **image_tags**.

- Example requests
  - Request for creating a system disk image with parameter **tags** using an ECS

    POST https://{Endpoint}/v2/cloudimages/action

    ```
    {
        "name": "ims_test",
         "description": "Create a system disk image from an ECS",
        "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
        "tags": [
           "aaa.111",
           "bbb.333",
           "ccc.444"
            ]
    }
    ```

  - Request for creating a data disk image with parameter **tags** using the data disk of an ECS

    POST https://{Endpoint}/v2/cloudimages/action

    ```
    {
        "data_images": [{"name": "ims_data_image_test",
        "description": "Create a data disk image from the data disk of an ECS",
        "volume_id": "c5dfbd0c-bf0a-4798-a453-61dc6b54aa30",
        "tags": [
                "aaa.111",
                "bbb.333",
                "ccc.444"
            ]
        }]
    }
    ```

  - Request for creating an image with parameter **tags** using an external image file uploaded to the OBS bucket

    POST https://{Endpoint}/v2/cloudimages/action

    ```
    {
        "name": "ims_test_file",
     "description": "Create an image from a file in the OBS bucket",
        "image_url": "ims-image:centos70.qcow2",
        "os_version": "CentOS 7.0 64bit",
        "min_disk": 40,
        "tags": [
            "aaa.111",
            "bbb.333",
            "ccc.444"
        ]
    }
    ```

  - Request for creating a system disk image with parameter **image_tags** using an ECS

    POST https://{Endpoint}/v2/cloudimages/action

    ```
    {
        "name": "ims_test",
        "description": "Create a system disk image from an ECS",
    ```

```
    "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
    "image_tags": [
{
        "key": "key2",
        "value": "value2"
      },
{
        "key": "key1",
        "value": "value1"
}
      ]
}
```

– Request for creating a data disk image with parameter **image_tags** using the data disk of an ECS

POST /v2/cloudimages/action

```
{
    "data_images": [{"name": "ims_data_image_test",
    "description": "Create a data disk image from the data disk of an ECS",
    "volume_id": "c5dfbd0c-bf0a-4798-a453-61dc6b54aa30",
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
    }]
}
```

– Request for creating an image with parameter **image_tags** using an external image file uploaded to the OBS bucket

POST https://{Endpoint}/v2/cloudimages/action

```
{
    "name": "ims_test_file",
    "description": "Create an image from a file in the OBS bucket",
    "image_url": "ims-image:centos70.qcow2",
    "os_version": "CentOS 7.0 64bit",
    "min_disk": 40,
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
}
```

– Request for creating a system disk image with parameter **tags** using a data disk

POST https://{Endpoint}/v2/cloudimages/action

```
{
    "name": "ims_test",
    "description": "Create a system disk image from a data disk",
    "volume_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
    "type": "ECS",
    "os_version": "CentOS 7.0 64bit",
    "tags": [
        "aaa.111",
        "bbb.333",
        "ccc.444"
      ]
}
```

– Request for creating a system disk image with parameter **image_tags** using a data disk

POST https://{Endpoint}/v2/cloudimages/action

```
{
    "name": "ims_test",
    "description": "Create a system disk image from a data disk",
    "volume_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
    "type": "ECS",
    "os_version": "CentOS 7.0 64bit",
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
}
```

Response

● Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response
```
STATUS CODE 200
{
    "job_id": "8a12fc664fb4daa3014fb4e581380005"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.4 Importing an Image File Quickly

Function

This API is used to quickly create a private image from an oversized external image file that has uploaded to the OBS bucket. Currently, only ZVHD2 and RAW image files are supported, and the size of an image file cannot exceed 1 TB.

The fast image creation function is only available for image files in RAW or ZVHD2 format. For other formats of image files that are smaller than 128 GB, you are advised to import these files with the common method.

The API is an asynchronous one. If it is successfully called, the cloud service system receives the request. However, you need to use the asynchronous job query API to query the image creation status. For details, see **Asynchronous Job Query**.

Constraints

Before importing image files, ensure that the file format is RAW or ZVHD2 and the following have been done:

- RAW image files have been optimized, and bitmap files have been generated.
- ZVHD2 image files have been optimized as required.

📖 NOTE

For how to convert image file formats and generate a bitmap file, see section "Quickly Importing an Image File" in the *Image Management Service User Guide*.

URI

POST /v2/cloudimages/quickimport/action

Request

- Parameters in the request body when an image file is used to create a system disk image

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
os_version	Yes	String	Specifies the OS version. This parameter is valid if an external image file uploaded to the OBS bucket is used to create an image. For its value, see **Values of Related Parameters**.

Parameter	Mandatory	Type	Description
image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket. This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The format is *OBS bucket name:Image file name*. **NOTE** The storage class of the OBS bucket must be **Standard**.
min_disk	Yes	Integer	Specifies the minimum size (GB) of the system disk. ● This parameter is mandatory if an external image file in the OBS bucket is used to create an image. ● The value ranges from 1 to 1024 and must be greater than the size of the selected image file.
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. Set either **tags** or **image_tags**.
image_tags	No	Array of objects	Lists the image tags. The value is left blank by default. Set either **tags** or **image_tags**.
type	No	String	Specifies the image type. The parameter value is ECS/BMS for system disk images. The default value is **ECS**.

Parameter	Mandatory	Type	Description
architecture	No	String	Specifies the image architecture type. Available values include: ● x86 ● arm The default value is **x86**. **NOTE** If the image architecture is ARM, the boot mode is automatically changed to UEFI.

● Parameters description when an image file uploaded to the OBS bucket is used to create an image

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
os_type	No	String	Specifies the OS version. When a data disk image created, the value can be **Linux** or **Windows**. The default is **Linux**.

Parameter	Mandatory	Type	Description
image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket. This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The format is *OBS bucket name:Image file name*. **NOTE** The storage class of the OBS bucket must be **Standard**.
min_disk	Yes	Integer	Specifies the minimum size of the system disk in the unit of GB. This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The value ranges from 1 to 1024.
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. Set either **tags** or **image_tags**.
image_tags	No	Array of objects	Lists the image tags. The value is left blank by default. Set either **tags** or **image_tags**.
type	Yes	String	Specifies the image type. The parameter value is DataImage for data disk images.

- Example requests
  - Creating a system disk image using an external image file
    POST https://{Endpoint}/v2/cloudimages/quickimport/action

    If parameter **tags** is used:

    ```
    {
      "name": "ims_test_file",
      "description": "Create an image using a file in the OBS bucket.",
      "image_url": "ims-image:centos70.zvhd2",
      "os_version": "CentOS 7.0 64bit",
      "min_disk": 40,
      "type": "ECS",
      "tags":
        [
    ```

```
            "aaa.111",
            "bbb.333",
            "ccc.444"
        ]
}
```

If parameter **image_tags** is used:

```
{
    "name": "ims_test_file",
    "description": "Create an image using a file in the OBS bucket.",
    "image_url": "ims-image:centos70.zvhd2",
    "os_version": "CentOS 7.0 64bit",
    "min_disk": 40,
    "type": "ECS",
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
}
```

– Creating a data disk image using an external image file
  POST https://{Endpoint}/v2/cloudimages/quickimport/action

If parameter **tags** is used:

```
{
    "name": "ims_test_file",
    "description": "Create an image using a file in the OBS bucket.",
    "image_url": "ims-image:centos70.qcow2",
    "os_type": "Linux",
    "min_disk": 40,
    "type": "DataImage",
    "tags": [
        "aaa.111",
        "bbb.333",
        "ccc.444"
    ]
}
```

If parameter **image_tags** is used:

```
{
    "name": "ims_test_file",
    "description": "Create an image using a file in the OBS bucket.",
    "image_url": "ims-image:centos70.qcow2",
    "os_type": "Linux",
    "min_disk": 40,
    "type": "DataImage",
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
}
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response
  STATUS CODE 200

```
{
    "job_id": "8a12fc664fb4daa3014fb4e581380005"
}
```

Returned Values

- Normal

200

- Abnormal

Return Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.5 Creating a Data Disk Image Using an External Image File

Function

This API is used to create a data disk image from a data disk image file uploaded to the OBS bucket. The API is an asynchronous one. If it is successfully called, the cloud service system receives the request. However, you need to use the asynchronous job query API to query the image creation status. For details, see **Asynchronous Job Query**.

URI

POST /v1/cloudimages/dataimages/action

Request

- Request parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.

Parameter	Mandatory	Type	Description
os_type	No	String	Specifies the OS type. It can only be Windows or Linux. The default is Linux.
image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket. The format is *OBS bucket name:Image file name*. **NOTE** The storage class of the OBS bucket must be **Standard**.
min_disk	Yes	Integer	Specifies the minimum size of the data disk. Value range: 40 GB to 2048 GB
cmk_id	No	String	Specifies the master key used for encrypting an image. For its value, see the *Key Management Service User Guide*.
tags	No	Array of strings	Specifies image tags. This parameter is left blank by default. For detailed parameter description, see **Image Tag Data Formats**. Use either **tags** or **image_tags**.
image_tags	No	Array of **ImageTag** objects	Lists the image tags. This parameter is left blank by default. Use either **tags** or **image_tags**.

Table 5-7 Data structure description of the image_tags field

Parameter	Mandatory	Type	Description
key	No	string	Specifies the tag key.
value	No	string	Specifies the tag value.

- Example requests
  - Request for creating an image (**tags**)
    POST https://{Endpoint}/v1/cloudimages/dataimages/action
    ```
    {
      "name": "fedora-data1",
      "image_url": "image-test:fedora_data1.qcow2",
      "description":"Data disk 1 of Fedora",
      "min_disk": 40,
      "tags": [
    ```

```
    "aaa.111",
    "bbb.222"
  ],
  "os_type": "Linux"
}
```

– Request for creating an image (**image_tags**)

```
POST https://{Endpoint}/v1/cloudimages/dataimages/action
{
  "name": "fedora-data2",
  "image_url": "image-test:fedora_data1.qcow2",
  "description":"Data disk 2 of Fedora",
  "min_disk": 40,
  "image_tags": [{"key":"aaa","value":"111"},{"key":"bbb","value":"222"}],
  "os_type": "Linux"
}
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response

```
STATUS CODE 200
{
    "job_id": "4010a32b5f909853015f90aaa24b0015"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.6 Creating a Full-ECS Image

Function

This API is used to create a full-ECS image from an ECS or a CBR backup. The API is an asynchronous one. If it is successfully called, the cloud system receives the request to create a full-ECS image. However, you need to use the asynchronous job query API to query the image creation status. For details, see **Asynchronous Job Query**.

Constraints (Creating a Full-ECS Image Using an ECS)

- When creating a full-ECS image from an ECS, ensure that the ECS has been properly configured, or the image creation may fail.
- A Windows ECS used to create a full-ECS image cannot have a spanned volume, or data may be lost when ECSs are created from that image.
- A Linux ECS used to create a full-ECS image cannot have a disk group or logical disk that contains multiple physical disks, or data may be lost when ECSs are created from that image.
- A full-ECS image cannot be replicated within a region or be exported.
- When creating a full-ECS image from a Windows ECS, you need to change the SAN policy of the ECS to OnlineAll. Otherwise, EVS disks attached to the ECSs created from the image may be offline.

  Windows has three types of SAN policies: **OnlineAll**, **OfflineShared**, and **OfflineInternal**.

  Table 5-8 SAN policies in Windows

Type	Description
OnlineAll	All newly detected disks are automatically brought online.
OfflineShared	All disks on sharable buses, such as iSCSI and FC, are left offline by default, while disks on non-sharable buses are kept online.
OfflineInternal	All newly detected disks are left offline.

  a. Execute **cmd.exe** and run the following command to query the current SAN policy of the ECS:

     diskpart

  b. Run the following command to view the SAN policy of the ECS:

     san

     - If the SAN policy is **OnlineAll**, run the **exit** command to exit DiskPart.

     - If the SAN policy is not **OnlineAll**, go to **c**.

  c. Run the following command to change the SAN policy of the ECS to **OnlineAll**:

san policy=onlineall

Constraints (Creating a Full-ECS Image Using a CBR Backup)

- When creating a full-ECS image from a CBR backup, ensure that the source ECS of the CBR backup has been properly configured, or the image creation may fail.
- A CBR backup can be used to create only one full-ECS image.
- If an ECS is in **Stopped** state, do not start it when you are using it to create a full-ECS image.
- A full-ECS image created from a CBR backup can be shared with other tenants. However, if it is a shared CBR backup, the full-ECS image created from it cannot be shared.
- A full-ECS image cannot be replicated within a region or be exported.

URI

POST /v1/cloudimages/wholeimages/action

Request

- Parameters for creating a full-ECS image using an ECS

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**.
tags	No	Array of strings	Lists the image tags. The value is left blank by default. Use either **tags** or **image_tags**.
image_tags	No	Array of objects	Lists the image tags. The value is left blank by default. Use either **tags** or **image_tags**.

Parameter	Mandatory	Type	Description
instance_id	Yes	String	Specifies the ECS ID. This parameter is required when an ECS is used to create a full-ECS image. To obtain the ECS ID, perform the following operations: 1. Log in to management console. 2. Under **Computing**, click **Elastic Cloud Server**. 3. In the ECS list, click the name of the ECS and view its ID.
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB. This parameter is not configured by default.
min_ram	No	Integer	Specifies the minimum memory of the image in the unit of MB. The default value is **0**.
vault_id	Yes	String	Specifies the ID of the vault to which an ECS is to be added or has been added. You can obtain the vault ID from the CBR console or section "Querying the Vault List" in *Cloud Backup and Recovery API Reference*.

- Parameters in the request body when a CBR backup is used to create a full-ECS image

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**.
tags	No	Array of strings	Lists the image tags. The value is left blank by default. Use either **tags** or **image_tags**.

Parameter	Mandatory	Type	Description
image_tags	No	Array of objects	Lists the image tags. The value is left blank by default. Use either **tags** or **image_tags**.
backup_id	Yes	String	Specifies the CBR backup ID. To obtain the CBR backup ID, perform the following operations: 1. Log in to the management console. 2. Under **Storage**, click **Cloud Backup and Recovery**. 3. On the displayed **Cloud Server Backup** page, click the **Backups** tab and obtain the backup ID from the backup list.
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB. This parameter is not configured by default.
min_ram	No	Integer	Specifies the minimum memory of the image in the unit of MB. The default value is **0**, indicating that the memory is not restricted.
whole_image_type	Yes	String	Specifies the method of creating the full-ECS image. The value must be **CBR**.

- Example requests
  - Creating a full-ECS image from an ECS
    POST https://{Endpoint}/v1/cloudimages/wholeimages/action

    If parameter **tags** is used:

    ```
    {
        "name": "instance_whole_image",
        "description": "creating an image from an ECS",
        "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
        "vault_id": "de9fcf45-11b2-432c-8562-5c5428574600",
        "tags": [
            "aaa.111",
            "bbb.333",
            "ccc.444"
        ]
    }
    ```

    If parameter **image_tags** is used:

    ```
    {
        "name": "instance_whole_image",
        "description": "creating an image from an ECS",
    ```

```
        "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
        "vault_id": "de9fcf45-11b2-432c-8562-5c5428574600",
        "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
    }
```

–   Creating a full-ECS image using a CBR backup
    POST https://{Endpoint}/v1/cloudimages/wholeimages/action

    If parameter **tags** is used:

```
{
    "name": "backup_whole_image",
    "description": "Creating a full-ECS image using a CBR backup",
    "backup_id": "9b27efab-4a17-4c06-bfa2-3e0cf021d3c3",
    "whole_image_type": "CBR",
    "tags": [
        "aaa.111",
        "bbb.333",
        "ccc.444"
     ]
}
```

    If parameter **image_tags** is used:

```
{
    "name": "backup_whole_image",
    "description": "Creating a full-ECS image using a CBR backup",
    "backup_id": "9b27efab-4a17-4c06-bfa2-3e0cf021d3c3",
    "whole_image_type": "CBR",
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]
}
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response
  STATUS CODE 200

```
{
    "job_id": "4010a32b5f909853015f90aaa24b0015"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.

Returned Value	Description
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.7 Registering an Image

Function

This API is used to register an image file as an uninitialized private image on the cloud platform.

The following describes how to use this API:

1. Upload the image file to an OBS bucket. For details, see "Object Storage Service User Guide".

2. Use the image metadata creation API to create image metadata. After the API is invoked successfully, save the image ID. For how to create image metadata, see **Creating Image Metadata (Native OpenStack API)**.

3. Use the API for registering images and the image ID obtained in **2** to register the image file as a private image.

4. After the API is successfully invoked as an asynchronous one, the cloud service system receives a request. Query the image status using the image ID and check whether the image file is successfully registered. When the image status changes to **active**, the image file is successfully registered as a private image.

   For details about how to query the status of an asynchronous task, see **Asynchronous Job Query**.

   ☐ NOTE

   Before registering an image file, ensure that you have the Tenant Administrator permission for OBS.

URI

PUT /v1/cloudimages/{image_id}/upload

Table 5-9 lists the parameters in the URI.

Table 5-9 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. ● **image_id** is the ID of the image you created by invoking the API for creating image metadata. Registration may fail if you use other image IDs. ● After this API is invoked, you can check the image status with the image ID. When the image status changes to **active**, the image file is successfully registered. For details, see **Querying Image Details (Native OpenStack API)**.

Request

● Request parameters

Parameter	Mandatory	Type	Description
image_url	Yes	String	Specifies the URL of the image file in the format of *Bucket name:File name*. Image files in the bucket can be in ZVHD, QCOW2, VHD, RAW, VHDX, QED, VDI, QCOW, ZVHD2, ISO, or VMDK format. **NOTE** The storage class of the OBS bucket must be **Standard**.

● Example request

```
PUT https://{Endpoint}/v1/cloudimages/4ca46bf1-5c61-48ff-b4f3-0ad4e5e3ba86/upload
{
    "image_url": "bucketname:Centos6.5-disk1.vmdk"
}
```

Response

● Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response
```
HTTP/1.1 200
{
    "job_id":" b912fb4a4c464b568ecfca1071b21b10"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.

5.1.8 Exporting an Image

Function

This is an extension API and used to export a private image to an OBS bucket.

📖 **NOTE**

Before exporting an image, ensure that you have the Tenant Administrator permission for OBS.

Constraints

- The following private images cannot be exported:
  - Full-ECS images
  - ISO images
  - Private images created from a Windows, SUSE, Red Hat, Ubuntu, or Oracle Linux public image
- The image size must be less than 1 TB. Images larger than 128 GB support only fast export.

URI

POST /v1/cloudimages/{image_id}/file

Table 5-10 lists the parameters in the URI.

Table 5-10 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see **Querying Images**.

Request

- Request parameters

Parameter	Mandatory	Type	Description
bucket_url	Yes	String	Specifies the URL of the image file in the format of *Bucket name:File name*. **NOTE** The storage class of the OBS bucket must be **Standard**.
file_format	Yes	String	Specifies the file format. The value can be **qcow2**, **vhd**, **zvhd**, or **vmdk**.
is_quick_export	No	Boolean	Whether to enable fast export. The value can be **true** or **false**. **NOTE** If fast export is enabled, **file_format** cannot be specified.

- Example request
  POST https://{Endpoint}/v1/cloudimages/d164b5df-1bc3-4c3f-893e-3e471fd16e64/file
  ```
  {
    "bucket_url": "ims-image:centos7_5.qcow2",
    "file_format": "qcow2",
    "is_quick_export": false
  }
  ```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response
```
STATUS CODE 200
{
    "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

Returned Values

- Normal

    200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.1.9 Querying Supported Image OSs

Function

This interface is used to query the list of compatible ECS OSs in the current region.

URI

GET /v1/cloudimages/os_version

Table 5-11 Parameter description

Parameter	Mandatory	Type	Description
tag	No	String	Specifies the OS tag. You can query OSs with specified features based on the tag value. Possible values are as follows: ● **bms**: indicates the BMS OS versions supported by the image. ● **uefi**: indicates the OS versions that support the UEFI boot mode. If this parameter is not specified, all the supported OSs in the current region are to be queried.

Request

- Request parameters

  None

- Example request

  - Querying supported OSs
    GET https://{Endpoint}/v1/cloudimages/os_version

  - Querying supported OSs by filters
    GET https://{Endpoint}/v1/cloudimages/os_version?tag=kvm&tag=uefi

Response

- Response parameters

Parameter	Type	Description
[Array]	Array of objects	For details, see **Table 5-12**.

Table 5-12 Data structure description of the [Array] field

Parameter	Type	Description
platform	String	Specifies the OS platform.
version_list	Array of objects	Specifies the returned OS details. For details, see **Table 5-13**.

Table 5-13 Data structure description of the [Array].version_list field

Parameter	Type	Description
platform	String	Specifies the OS platform.
os_version_key	String	Specifies the key value of the OS. The default key value is the value of **os_version**.
os_version	String	Specifies the complete OS information.
os_bit	Integer	Specifies the OS bit.
os_type	String	Specifies the OS type.

- Example response
STATUS CODE 200
```
[
  {
    "platform": "SUSE",
    "version_list": [
      {
        "platform": "SUSE",
        "os_version_key": "SUSE Linux Enterprise Server 15 64bit",
        "os_version": "SUSE Linux Enterprise Server 15 64bit",
        "os_bit": 64,
        "os_type": "Linux"
      },
      {
        "platform": "SUSE",
        "os_version_key": "SUSE Linux Enterprise Server 12 SP3 64bit",
        "os_version": "SUSE Linux Enterprise Server 12 SP3 64bit",
        "os_bit": 64,
        "os_type": "Linux"
      }
    ]
  },
  {
    "platform": "Other",
    "version_list": [
      {
        "platform": "Other",
        "os_version_key": "Other(32 bit)",
        "os_version": "Other(32 bit)",
        "os_bit": 32,
        "os_type": "Linux"
      }
    ]
  }
]
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.2 Image Sharing

5.2.1 Deleting Image Members in Batches

Function

This API is an extension one and used to stop sharing images by deleting tenants with whom the image is shared in batches.

This API is an asynchronous one. If **job_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see **Asynchronous Job Query**.

URI

DELETE /v1/cloudimages/members

Request

- Request parameters

Parameter	Mandatory	Type	Description
images	Yes	Array of strings	Specifies the image IDs.
projects	Yes	Array of strings	Specifies the project IDs.

- Example request
```
DELETE https://{Endpoint}/v1/cloudimages/members
{
 "images": [
     "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
```

```
      "0b680482-acaa-4045-b14c-9a8c7dfe9c70"
  ],
  "projects": [
      "9c61004714024f9586705d090530f9fa",
      "edc89b490d7d4392898e19b2deb34797"
  ]
}
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous task ID. For details, see **Asynchronous Job Query**.

- Example response
```
STATUS CODE 200
{
  "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.2.2 Adding Image Members in Batches

Function

This API is an extension one and used to share more than one image with multiple tenants.

This API is an asynchronous one. If **job_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For

details about how to query the status of an asynchronous task, see **Asynchronous Job Query**.

URI

POST /v1/cloudimages/members

Request

- Request parameters

Parameter	Mandatory	Type	Description
images	Yes	Array of strings	Specifies the image IDs.
projects	Yes	Array of strings	Specifies the project IDs.

- Example request

```
POST https://{Endpoint}/v1/cloudimages/members
{
    "images": [
        "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
        "0b680482-acaa-4045-b14c-9a8c7dfe9c70"
    ],
    "projects": [
        "9c61004714024f9586705d090530f9fa",
        "edc89b490d7d4392898e19b2deb34797"
    ]
}
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous task ID. For details, see **Asynchronous Job Query**.

- Example response

```
STATUS CODE 200
{
    "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.2.3 Updating the Status of Image Members in Batches

Function

This API is an extension one and used to update the image sharing status after the tenant accepts or rejects the shared images.

This API is an asynchronous one. If **job_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see **Asynchronous Job Query**.

URI

PUT /v1/cloudimages/members

Request

- Request parameters

Parameter	Mandatory	Type	Description
images	Yes	Array of strings	Specifies the image IDs.
project_id	Yes	String	Specifies the project ID.

Parameter	Mandatory	Type	Description
status	Yes	String	Specifies whether a shared image will be accepted or declined. The value can be one of the following: • **accepted**: indicates that a shared image is accepted. After an image is accepted, the image is displayed in the image list. You can use the image to create ECSs. • **rejected**: indicates that a shared image is declined. After an image is declined, the image is not displayed in the image list. However, you can still use the image to create ECSs.
vault_id	Yes	String	Specifies the vault ID. You can obtain the vault ID from the CBR console or section "Querying the Vault List" in *Cloud Backup and Recovery API Reference*.

● Example request

– If the shared images do not include full-ECS images:
```
PUT https://{Endpoint}/v1/cloudimages/members
{
  "images": [
      "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
      "0b680482-acaa-4045-b14c-9a8c7dfe9c70"
    ],
    "project_id": "edc89b490d7d4392898e19b2deb34797",
    "status": "accepted"
}
```

– If the shared images include full-ECS images:
```
PUT https://{Endpoint}/v1/cloudimages/members
{
  "images": [
      "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
      "0b680482-acaa-4045-b14c-9a8c7dfe9c70"
    ],
    "project_id": "edc89b490d7d4392898e19b2deb34797",
    "status": "accepted",
    "vault_id": "d14r5tef-1bc3-4c4f-823e-3e471rg65e65"
}
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response

```
STATUS CODE 200
{
    "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

Returned Values

- Normal

200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.3 Image Replication

5.3.1 Replicating an Image Within a Region

Function

This API is an extension one and is used to copy an existing image to another image. When replicating an image, you can change the image attributes to meet the requirements of different scenarios.

This API is an asynchronous one. If **job_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see **Asynchronous Job Query**.

Constraints

- Full-ECS images cannot be replicated within the same region.
- Private images created using ISO files do not support in-region replication.

URI

POST /v1/cloudimages/{image_id}/copy

Table 5-14 lists the parameters in the URI.

Table 5-14 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see **Querying Images**.

Request

- Request parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
cmk_id	No	String	Specifies the encryption key. This parameter is left blank by default.

- Example request
  POST https://{Endpoint}/v1/cloudimages/465076de-dc36-4aec-80f5-ef9d8009428f/copy
  {
      "name": "ims_encrypted_copy3",

```
      "description": "test copy",
      "cmk_id": "bd66288c-9081-460a-8227-4cbd0c814cb4"
   }
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see **Asynchronous Job Query**.

- Example response

```
STATUS CODE 200
{
   "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.3.2 Replicating an Image Across Regions

Function

This API is an extension one and is used to replicate a private from one region to another region to create ECSs of the same type. This allows you to migrate services between regions.

This API is an asynchronous one. If **job_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails.

Constraints

- The destination region cannot be the same as the source region.
- Encrypted images do not support cross-region replication.
- The size of each image to be replicated across regions cannot be larger than 128 GB.
- A maximum of five private images can be replicated at a time.
- Private images created using ISO files do not support cross-region replication.

URI

POST /v1/cloudimages/{image_id}/cross_region_copy

Table 5-15 lists the parameters in the URI.

Table 5-15 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see **Querying Images**.

Request

- Request parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see **Image Attributes**.
description	No	String	Provides supplementary information about the image. For detailed description, see **Image Attributes**. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.

Parameter	Mandatory	Type	Description
region	Yes	String	Specifies the ID of the destination region. For details about how to obtain region IDs, see section "Listing Regions" in *Identity and Access Management API Reference*.
project_name	Yes	String	Specifies the name of the project in the destination region.
agency_name	Yes	String	Specifies the agency name. For details about how to create an IAM agency, see "How Do I Create an IAM Agency?" in *Image Management Service User Guide*.
vault_id	No	String	Specifies the vault ID. This parameter is mandatory if you are replicating a full-ECS image. You can obtain the vault ID from the CBR console or by referring to "Querying the Vault List" in *Cloud Backup and Recovery API Reference*.

- Example request
  - If the image is not a full-ECS image:
    ```
    POST https://{Endpoint}/v1/cloudimages/465076de-dc36-4aec-80f5-ef9d8009428f/
    cross_region_copy
    {
        "name":"test-copy-1001-4",
        "description":"test",
        "region":"region-1",
        "project_name":"region-1",
        "agency_name":"ims_copy_image"
    }
    ```
  - If the image is a full-ECS image:
    ```
    POST https://{Endpoint}/v1/cloudimages/465076de-dc36-4aec-80f5-ef9d8009428f/
    cross_region_copy
    {
        "name":"test-copy-1001-4",
    ```

```
        "description":"test",
        "region":"region-1",
        "project_name":"region-1",
        "agency_name":"ims_copy_image",
        "vault_id":"6yhtb5df-1bc3-4c3f-893e-3e4716yhgt61"
    }
```

Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous task ID.

- Example response

```
STATUS CODE 200
{
    "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.4 Image Quota

5.4.1 Querying the Image Quota

Function

This extension API is used to query the quota of private images of a tenant in the current region.

URI

GET /v1/cloudimages/quota

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v1/cloudimages/quota

Response

- Response parameters

Parameter	Type	Description
quotas	Object	Specifies the quota information. For details, see **Table 5-16**.

Table 5-16 Data structure description of the quotas field

Parameter	Type	Description
resources	Array of objects	Specifies the images included in the quota. For details, see **Table 5-17**.

Table 5-17 Data structure description of the quotas.resources field

Parameter	Type	Description
type	String	Specifies the type of the resource to be queried.
used	Integer	Specifies the used quota.
quota	Integer	Specifies the total quota.
min	Integer	Specifies the minimum quota.
max	Integer	Specifies the maximum quota.

- Example response

```
STATUS CODE 200
{
  "quotas": {
    "resources": [
      {
        "type": "image",
        "used": 0,
        "quota": 20,
        "min": 1,
```

```
      "max": 1000
    }
  ]
 }
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

5.5 Image Jobs

5.5.1 Asynchronous Job Query

Function

This is an extension API. It is used to query for the execution status of an asynchronous job, for example, querying for the execution status of an image exporting job.

URI

GET /v1/{project_id}/jobs/{job_id}

Table 5-18 lists the parameters in the URI.

Table 5-18 Parameter description

Parameter	Mandatory	Description
project_id	Yes	Specifies the project ID.
job_id	Yes	Specifies the asynchronous job ID.

Request

- Request parameters

  None

- Example request

  GET /v1/ac234de25c6741d2b1273da49eea1b9e/jobs/
  ff8080814dbd65d7014dbe0d84db0013

Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the job status. The value can be: • **SUCCESS**: The job is successfully executed. • **FAIL**: The job failed to be executed. • **RUNNING**: The job is in progress. • **INIT**: The job is being initialized.
job_id	String	Specifies the job ID.
job_type	String	Specifies the job type.
begin_time	String	Specifies the start time of the job. The value is in UTC format.
end_time	String	Specifies the end time of the job. The value is in UTC format.
error_code	String	Specifies the error code.
fail_reason	String	Specifies the failure cause.
entities	Object	Specifies the custom attributes of the job. If the job status is normal, the image ID will be returned. If the status is abnormal, an error code and details will be returned. For details, see **Table 5-19**.

Table 5-19 Data structure description of the entities field

Parameter	Type	Description
image_id	String	Specifies the image ID.
current_task	String	Specifies the job name.
image_name	String	Specifies the image name.

Parameter	Type	Description
process_percent	Double	Specifies the job progress.
results	Array of result objects	Specifies job execution results. For details, see **Table 5-20**.
sub_jobs_result	Array of SubJobResult objects	Specifies sub-job execution results. For details, see **Table 5-21**.
sub_jobs_list	Array of string	Specifies the sub-job IDs.

Table 5-20 Data structure description of the result field

Parameter	Type	Description
image_id	String	Specifies the image ID.
project_id	String	Specifies the project ID.
status	String	Specifies the job status.

Table 5-21 Data structure description of the SubJobResult field

Parameter	Type	Description
status	String	Specifies the sub-job status. The value can be: • **SUCCESS**: The sub-job is successfully executed. • **FAIL**: The sub-job failed to be executed. • **RUNNING**: The sub-job is in progress. • **INIT**: The sub-job is being initialized.
job_id	String	Specifies a sub-job ID.
job_type	String	Specifies the sub-job type.
begin_time	String	Specifies the start time of the sub-job. The value is in UTC format.
end_time	String	Specifies the end time of the sub-job. The value is in UTC format.
error_code	String	Specifies the error code.
fail_reason	String	Specifies the failure cause.

Parameter	Type	Description
entities	Object SubJobEntities	Specifies the custom attributes of the sub-job. For details, see **Table 5-22**. ● If a sub-job is properly executed, an image ID is returned. ● If an exception occurs on the sub-job, an error code and associated information are returned.

Table 5-22 Data structure description of the SubJobEntities field

Parameter	Type	Description
image_id	String	Specifies the image ID.
image_name	String	Specifies the image name.

● Example response

```
STATUS CODE 200
{
    "status": "SUCCESS",
    "entities": {
        "image_id": "e9e91bff-14b6-4a0b-8377-4ed0813e3360",
        "image_name": "asdfasdfasdfas",
        "process_percent": 0.20,
        "current_task": "CreateImageByInstanceTask",
        "results": [{
                "image_id": "49e9447f-7dff-41e0-8036-f66fe5488c8b",
                "project_id": "089b2f9a3d80d3062f24c00ca4ed5cbd",
                "status": "success"
            }
        ]
    },
    "job_id": "ff8080814dbd65d7014dbe0d84db0013",
    "job_type": "createImageByInstance",
    "begin_time": "04-Jun-2015 18:11:06:586",
    "end_time": "",
    "error_code": null,
    "fail_reason": null
}
```

Returned Values

● Normal

200

● Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.

Returned Value	Description
403 Forbidden	You do not have the rights to perform the operation.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6 Native OpenStack APIs

6.1 Image (Native OpenStack APIs)

6.1.1 Querying Images (Native OpenStack API)

Function

This API is used to obtain the image list.

This API does not return the complete result at once, but uses pagination.

Pagination

Pagination refers to the function of returning a subset of a group of images, a link to obtain the next set of images, and a link of the set of images. By default, a set contains 25 images. You can also use the **limit** and **marker** parameters to paginate through images manually and specify the number of images that can be returned.

The parameter **first** in the response indicates the URL of the first page of images, and parameter **next** indicates the URL of the next page of images. When the last page of images is queried, there is no parameter **next**.

URI

GET /v2/images

📖 NOTE

- You can type a question mark (?) and an ampersand (&) at the end of the URI to define multiple search criteria. For details, see the example request.
- If you need the API of the OpenStack Queens release, the request header must contain **X-Api-Version**. If the value of **X-Api-Version** is any letter after **M** in the Alphabet, the API of the Queens release is returned. If the value is **M** or a letter before **M**, the API of the Mitaka release is returned.

Table 6-1 lists the parameters.

Table 6-1 Parameter description

Parameter	Mandatory	Type	Description
__isregistered	No	String	Specifies whether the image is available. The value can be **true**. The value is **true** for all extension APIs by default. Common users can query only the images for which the value of this parameter is **true**.
__imagetype	No	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
protected	No	Boolean	Specifies whether the image is protected. The value is **true** or **false**. Set it to **true** when you query public images. This parameter is optional when you query private images.
visibility	No	String	Specifies whether the image is available to other tenants. Available values include: ● **public**: public image ● **private**: private image ● **shared**: shared image
owner	No	String	Specifies the tenant to which the image belongs.
id	No	String	Specifies the image ID.

Parameter	Mandatory	Type	Description
status	No	String	Specifies the image status. The value can be one of the following: ● **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. ● **saving**: indicates that the image file is being uploaded to the backend storage. ● **deleted**: indicates that the image has been deleted. ● **killed**: indicates that an error occurs on the image uploading. ● **active**: indicates that the image is available for use.
name	No	String	Specifies the image name. Exact matching is used. For detailed description, see **Image Attributes**.
container_for mat	No	String	Specifies the container type. The default value is **bare**.
disk_format	No	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is **0**.
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.
__os_bit	No	String	Specifies the OS architecture, 32 bit or 64 bit.

Parameter	Mandatory	Type	Description
__platform	No	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
marker	No	String	Specifies the start number from which images are queried. The value is the image ID.
limit	No	Integer	Specifies the number of images to be queried. The value is an integer. By default, 25 images can be queried.
sort_key	No	String	Specifies the field for sorting the query results. The value can be an attribute of the image: **name**, **container_format**, **disk_format**, **status**, **id**, **size**, or **create_at**. The default value is **create_at**.
sort_dir	No	String	Specifies whether the query results are sorted in ascending or descending order. Its value can be **desc** (default) or **asc**. This parameter is used together with parameter **sort_key**. The default value is **desc**.
__os_type	No	String	Specifies the image OS type. The value can be **Linux**, **Windows**, or **Other**.
tag	No	String	Specifies a tag added to an image. Tags can be used as a filter to query images. **NOTE** The tagging function has been upgraded. If the tags added before the function upgrade are in the format of "Key.Value", query tags using "Key=Value". For example, an existing tag is **a.b**. After the tag function upgrade, query the tag using "tag=a=b".

Parameter	Mandatory	Type	Description
member_status	No	String	Specifies the member status. The value can be **accepted**, **rejected**, or **pending**. **accepted**: indicates that the shared image is accepted. **rejected** indicates that the image shared by others is rejected. **pending** indicates that the image shared by others needs to be confirmed. To use this parameter, set **visibility** to **shared** during the query.
__support_kvm	No	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	No	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_largememory	No	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required. For details about the image OSs supported by large-memory ECSs, see **Table 9-4**.
__support_diskintensive	No	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required. For details about the image OSs supported by disk-intensive ECSs, see **Table 9-4**.
__support_highperformance	No	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required. For details about the image OSs supported by high-performance computing ECSs, see **Table 9-4**.

Parameter	Mandatory	Type	Description
__support_xen_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. For details about the image OSs supported by GPU-accelerated ECSs, see **Table 9-2**. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_xen_hana	No	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_infiniband	No	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen**.

Parameter	Mandatory	Type	Description
created_at	No	String	Specifies the time when the image was created. Images can be queried by time. The value is in the format of *Operator:UTC time*. The following operators are supported: • gt: greater than • gte: greater than or equal to • lt: less than • lte: less than or equal to • eq: equal to • neq: not equal to The time format is *yyyy-MM-ddThh:mm:ssZ* or *yyyy-MM-dd hh:mm:ss*. For example, to query images created before Oct 28, 2018 10:00:00, set the value of **created_at** to **lt: 2018-10-28T10:00:00Z**.
updated_at	No	String	Specifies the time when the image was modified. Images can be queried by time. The value is in the format of *Operator:UTC time*. The following operators are supported: • gt: greater than • gte: greater than or equal to • lt: less than • lte: less than or equal to • eq: equal to • neq: not equal to The time format is *yyyy-MM-ddThh:mm:ssZ* or *yyyy-MM-dd hh:mm:ss*. For example, to query images updated before Oct 28, 2018 10:00:00, set the value of **updated_at** to **lt: 2018-10-28T10:00:00Z**.

Common Query Methods

- Public images

  GET /v2/images?__imagetype=gold&visibility=public&protected=true

- Private images

  GET /v2/images?owner={project_id}

- Available shared images

  GET /v2/images?
  member_status=accepted&visibility=shared&__imagetype=shared

- Rejected images

  GET /v2/images?
  member_status=rejected&visibility=shared&__imagetype=shared

- Unaccepted images

  GET /v2/images?
  member_status=pending&visibility=shared&__imagetype=shared

Request

- Request parameters

  None

- Example request
  ```
  GET https://{Endpoint}/v2/images
  ```

Response

- Response parameters

Parameter	Type	Description
first	String	Specifies the URL of the first page of images.
next	String	Specifies the URL of the next page of images. When the last page of images is queried, there is no parameter **next**.
schema	String	Specifies the URL for the schema describing a list of images.
images	Array of objects	Specifies the resource type. For details, see **Table 6-2**.

Table 6-2 Data structure description of the images field

Parameter	Type	Description
__backup_id	String	Specifies the backup ID. If the image is created from a backup, set the value to the backup ID. Otherwise, this parameter is not required.
__data_origin	String	Specifies the image source. If the image is a public image, the value is left empty.
__description	String	Specifies the image description.
__image_location	String	Specifies the location where the image is stored.
__image_size	String	Specifies the size (bytes) of the image file. The value is greater than 0.
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.
__is_config_init	String	Specifies whether initial configuration is complete. The value can be **true** or **false**.
__isregistered	String	Specifies whether the image is available. The value can be **true**. The value is **true** for all extension APIs by default. Common users can query only the images for which the value of this parameter is **true**.
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be **true**, **false**, **True**, or **False**.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, the value is left empty.

Parameter	Type	Description
__imagetype	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
protected	Boolean	Specifies whether the image is protected. Set it to **true** when you query public images. This parameter is optional when you query private images.
virtual_env_type	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. ● For an ECS image (system disk image), the value is **FusionCompute**. ● For a data disk image, the value is **DataImage**. ● For a BMS image, the value is **Ironic**. ● For an ISO image, the value is **IsoImage**.
virtual_size	Integer	This parameter is unavailable currently.
visibility	String	Specifies whether the image is available to other tenants. The value can be one of the following: ● **public**: public image ● **private**: private image ● **shared**: shared image
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: • **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. • **saving**: indicates that the image file is being uploaded to the backend storage. • **deleted**: indicates that the image has been deleted. • **killed**: indicates that an error occurs on the image uploading. • **active**: indicates that the image is available for use.
name	String	Specifies the image name. For detailed description, see **Image Attributes**.
container_format	String	Specifies the container type.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is **0**.
max_ram	String	Specifies the maximum memory (MB) of the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.

Parameter	Type	Description
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__platform	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
schema	String	Specifies the image schema.
self	String	Specifies the image URL.
size	Integer	This parameter is unavailable currently.
__os_type	String	Specifies the image OS type. The value can be **Linux**, **Windows**, or **Other**.
__os_version	String	Specifies the OS version.
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required. For details about the image OSs supported by large-memory ECSs, see **Table 9-4**.

Parameter	Type	Description
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required. For details about the image OSs supported by disk-intensive ECSs, see **Table 9-4**.
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required. For details about the image OSs supported by high-performance computing ECSs, see **Table 9-4**.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. For details about the image OSs supported by GPU-accelerated ECSs, see **Table 9-2**. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.

Parameter	Type	Description
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen**.
__root_origin	String	Specifies that the image is created from an external image file. Value: **file**
__sequence_num	String	Specifies the ECS system disk slot number corresponding to the image. Example value: **0**
__support_fc_inject	String	Specifies whether the image supports password/private key injection using Cloud-Init. If the value is set to **true**, password/private key injection using Cloud-Init is not supported. **NOTE** This parameter is valid only for ECS system disk images.
created_at	String	Specifies the time when the image was created. The value is in UTC format.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
active_at	String	Specifies the time when the image status became **active**.
checksum	String	This parameter is unavailable currently.

Parameter	Type	Description
hw_firmware_type	String	Specifies the ECS boot mode. Available values include: • **bios** indicates the BIOS boot mode. • **uefi** indicates the UEFI boot mode.
file	String	Specifies the URL for uploading and downloading the image file.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be **true** or **false**.
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be **true** or **false**.

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.1.2 Querying Image Details (Native OpenStack API)

Function

This API is used to query details about a public or private image.

URI

GET /v2/images/{image_id}

Table 6-3 lists the parameters.

Table 6-3 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

Request

- Request parameters

  None

- Example request
  GET https://{Endpoint}/v2/images/33ad552d-1149-471c-8190-ff6776174a00

Response

- Response parameters

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: • **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. • **saving**: indicates that the image file is being uploaded to the backend storage. • **deleted**: indicates that the image has been deleted. • **killed**: indicates that an error occurs on the image uploading. • **active**: indicates that the image is available for use.
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.
visibility	String	Specifies whether the image is available to other tenants. Available values include: • **private**: private image • **public**: public image • **shared**: shared image
name	String	Specifies the image name. For detailed description, see **Image Attributes**.
checksum	String	This parameter is unavailable currently.

Parameter	Type	Description
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be **true** or **false**.
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is **0**.
max_ram	String	Specifies the maximum memory (MB) of the image. You can set this parameter based on the ECS specifications. Generally, you do not need to set this parameter.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Specifies the image description. For detailed description, see **Image Attributes**.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be **true** or **false**.

Parameter	Type	Description
__platform	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
__os_type	String	Specifies the OS type. The value can be **Linux**, **Windows**, or **Other**.
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. • For an ECS image (system disk image), the value is **FusionCompute**. • For a data disk image, the value is **DataImage**. • For a BMS image, the value is **Ironic**. • For an ISO image, the value is **IsoImage**.
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.

Parameter	Type	Description
__imagetype	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. To create an image using a backup, set the value to the backup ID. Otherwise, this value is left empty.
__image_size	String	Specifies the size (bytes) of the image file. The value is greater than 0.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
__root_origin	String	Specifies that the image is created from an external image file. Value: **file**
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be **true**, **false**, **True**, or **False**.

Parameter	Type	Description
active_at	String	Specifies the time when the image status became **active**.
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__sequence_num	String	This parameter is unavailable currently.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required. For the supported OSs, see **Table 9-4**.
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required.

Parameter	Type	Description
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See **Table 9-2** for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This attribute cannot co-exist with __**support_xen**.

Parameter	Type	Description
__support_fc_inject	String	Specifies whether the image supports password/private key injection using Cloud-Init. The parameter value can be **true** or **false**. If the value is set to **true**, password/private key injection using Cloud-Init is not supported. **NOTE** This parameter is valid only for ECS system disk images.
hw_firmware_type	String	Specifies the ECS boot mode. Available values include: • **bios** indicates the BIOS boot mode. • **uefi** indicates the UEFI boot mode.
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be **true** or **false**.
__image_location	String	Specifies the location where the image is stored.
__is_config_init	String	Specifies whether initial configuration is complete. The value can be **true** or **false**.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be **true** or **false**.

6.1.3 Updating Image Information (Native OpenStack API)

Function

This API is used to modify image information.

Constraints

Only customized attributes, image name, and image description can be modified.

URI

PATCH /v2/images/{image_id}

Table 6-4 lists the parameters.

Table 6-4 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see **Querying Images**.

Request

- Request parameters

  Glance has two methods of updating image information. The method is specified by **Content-Type** in the HTTP header. **application/openstack-images-v2.0-json-patch** and **application/openstack-images-v2.1-json-patch** are supported. Content types differ only in the format of the request message body.

  Table 6-5 v2.1 request message body

Parameter	Mandatory	Type	Description
[Array]	Yes	Array of objects	For details, see **Table 6-6**.

  Table 6-6 Data structure description of the [Array] field

Parameter	Type	Mandatory	Description
op	String	Yes	Indicates the type of the update operation, including replacing, adding, and deleting an attribute. The value can be **replace**, **add**, or **remove**.

Parameter	Type	Mandatory	Description
path	String	Yes	Indicates the name of the target attribute. For **replace** and **remove**, the value can only be an existing attribute of the image. For **add**, the value can be an existing or a new attribute. If the value is an existing attribute, **add** takes the same effect as **replace**. If the value is a new attribute, the **add** operation is performed. Add a slash (/) before the attribute name.
value	String	No	Indicates the value of the attribute to be updated or added. Mandatory for **replace** and **add**, and not for **remove**

Table 6-7 v2.0 request message body

Parameter	Mandatory	Type	Description
[Array]	Yes	Array of objects	For details, see **Table 6-8**.

Table 6-8 Data structure description of the [Array] field

Parameter	Type	Mandatory	Description
replace	String	Mandatory for any of the three values	Indicates that an image attribute will be replaced. The value is the attribute to be replaced and a slash (/) must be added in front of the attribute name.
add	String		Indicates that an image attribute will be added. The value is the attribute to be added and a slash (/) must be added in front of the attribute name.

Parameter	Type	Mandatory	Description
remove	String		Indicates that an image attribute will be deleted. The value is the attribute to be deleted and a slash (/) must be added in front of the attribute name.
value	String	Mandatory for **replace** and **add**, and not for **remove**	Indicates the value of the attribute to be updated or added. For detailed description, see **Image Attributes**.

- Example request
  PATCH https://{Endpoint}/v2/images/33ad552d-1149-471c-8190-ff6776174a00
  - v2.1 request body
    ```
    "Content-Type:application/openstack-images-v2.1-json-patch"
    [
        {
            "op": "replace",
            "path": "/name",
            "value": "test01"
        }
    ]
    ```
  - v2.0 request body
    ```
    "Content-Type:application/openstack-images-v2.0-json-patch"
    [
        {
            "replace": "/name",
            "value": "test01"
        }
    ]
    ```

Response

- Response parameters

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.

Parameter	Type	Description
status	String	Specifies the image status. The value can be: • **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. • **saving**: indicates that the image file is being uploaded to the backend storage. • **deleted**: indicates that the image has been deleted. • **killed**: indicates that an error occurs on the image uploading. • **active**: indicates that the image is available for use.
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.
visibility	String	Specifies whether the image is available to other tenants. The value can be: • **private**: private image • **public**: public image • **shared**: shared image
name	String	Specifies the image name. For detailed description, see **Image Attributes**.
checksum	String	This parameter is unavailable currently.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be **true** or **false**.
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. The default value is **0**.

Parameter	Type	Description
max_ram	String	Specifies the maximum memory (MB) of the image. The parameter value depends on the ECS specifications and is not configured by default.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Specifies the image description. For detailed description, see **Image Attributes**.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be **true** or **false**.
__platform	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
__os_type	String	Specifies the OS type. The value can be **Linux**, **Windows**, or **Other**.
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB.

Parameter	Type	Description
virtual_env_type	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. ● For an ECS image (system disk image), the value is **FusionCompute**. ● For a data disk image, the value is **DataImage**. ● For a BMS image, the value is **Ironic**. ● For an ISO image, the value is **IsoImage**.
__image_source _type	String	Specifies the backend storage of the image. Only UDS is supported currently.
__imagetype	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimage name	String	Specifies the parent image ID. If the image is a public image or created from an image file, the value is left empty.
__backup_id	String	Specifies the backup ID. If the image is created from a backup, set the value to the backup ID. Otherwise, this parameter is not required.
__image_size	String	Specifies the size (bytes) of the image file. The value must be greater than **0**.
__data_origin	String	Specifies the image source. If the image is a public image, the value is left empty.

Parameter	Type	Description
__root_origin	String	Specifies that the image is created from an external image file. Value: **file**
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be **true**, **false**, **True**, or **False**.
active_at	String	Specifies the time when the image status became **active**.
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__account_code	String	Specifies the charging identifier for the image.
hw_firmware_type	String	Specifies the ECS boot mode. The value can be: ● **bios** indicates the BIOS boot mode. This value will be used by fault if this parameter does not exist in the response. ● **uefi** indicates the UEFI boot mode.
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be **true** or **false**.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_large memory	String	Specifies whether the image can be used to create large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required. For the supported OSs, see **Table 9-4**.

Parameter	Type	Description
__support_diskintensive	String	Specifies whether the image can be used to create disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image can be used to create high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See **Table 9-2** for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This parameter cannot co-exist with __**support_xen** and __**support_kvm**.
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is **true**. Otherwise, this parameter is not required. This parameter cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with the InfiniBand NIC on the KVM platform. If yes, the value is **true**. Otherwise, this parameter is not required. This parameter cannot co-exist with __**support_xen**.
__sequence_num	String	Specifies the ECS system disk slot number corresponding to the image. This parameter is unavailable currently.

Parameter	Type	Description
__support_fc_inject	String	Specifies whether the image supports password/private key injection using Cloud-Init. If the value is set to **true**, password/private key injection using Cloud-Init is not supported. **NOTE** This parameter is valid only for ECS system disk images.
__image_location	String	Specifies the location where the image is stored.
__is_config_init	String	Specifies whether initial configuration is complete. The value can be **true** or **false**.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be **true** or **false**.

Parameter	Type	Description
__support_agent_list	String	Specifies the agents configured for the image. • **hss**: The Host Security Service (HSS) agent is configured for the image. Host Security Service (HSS) is designed to improve the overall security for ECSs. It helps you identify and manage the information on your ECSs, eliminate risks, and defend against intrusions and web page tampering. • **ces**: The host monitoring agent is configured for the image. Monitoring is key for ensuring ECS performance, reliability, and availability. Using monitored data, you can determine ECS resource utilization. The cloud platform provides Cloud Eye to help you obtain the running statuses of your ECSs. You can use Cloud Eye to automatically monitor ECSs in real time and manage alarms and notifications to keep track of ECS performance metrics. Example: "__support_agent_list": "hss,ces" **NOTE** If the response does not contain this field, the HSS and host monitoring agents are not configured for the image.

404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.1.4 Uploading an Image (Native OpenStack API)

Function

This API is used to upload a local image to the cloud platform. The image to be uploaded must be smaller than 2 GB. To upload an image larger than 2 GB, see **Registering an Image**.

For more information about how to use external files to create images, see sections "Creating a Private Windows Image Using an External Image File" and "Creating a Private Linux Image Using an External Image File" in *Image Management Service User Guide*.

The following describes how to use this API:

1. Prepare the image to be uploaded. The image can be in QCOW2, VMDK, VHD, RAW, VHDX, QED, VDI, QCOW, ZVHD2, or ZVHD format.

2. Create metadata for the image by performing the operations in **Creating Image Metadata (Native OpenStack API)**. After the API is invoked successfully, save the image ID.

3. Upload the image file with the image ID obtained in **2**.

URI

PUT /v2/images/{image_id}/file

Table 6-9 lists the parameters in the URI.

Table 6-9 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. ● **image_id** is the ID of the image you created by invoking the API for creating image metadata. Image upload may fail if you use other image IDs. ● After this API is invoked, you can check the image status with the image ID. When the image status changes to **active**, the image is uploaded successfully.

Request

● Request parameters

Parameter	Mandatory	Type	Description
image_file	Yes	file	Specifies the local file to be uploaded.

● Example request
PUT https://{Endpoint}/v2/images/84ac7f2b-bf19-4efb-86a0-b5be8771b476/file

> 📖 **NOTE**
>
> If you use the curl command to call the API, the example request is as follows:
>
> ```
> curl -i --insecure 'https://IP/v2/images/84ac7f2b-bf19-4efb-86a0-b5be8771b476/file' -X PUT -H
> "X-Auth-Token: $mytoken" -H "Content-Type:application/octet-stream" -T /mnt/userdisk/images/
> suse.zvhd
> ```

Response

● Response parameters
None

● Example response
HTTP/1.1 204

Returned Values

- Normal

  204

- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see **Error Codes**.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
409 Conflict	Request conflict.
500 System Error	System error.

6.1.5 Deleting an Image (Native OpenStack API)

Function

This API is used to delete a private image. You can only delete your own private images.

URI

DELETE /v2/images/{image_id}

Table 6-10 lists the parameters in the URI.

Table 6-10 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

Request

- Request parameters

Parameter	Mandatory	Type	Description
delete_backup	No	Boolean	Specifies whether to delete the CBR backups associated with a full-ECS image when the image is deleted. The value can be **true** or **false**. ● **true**: When a full-ECS image is deleted, its CBR backups are also deleted. ● **false**: When a full-ECS image is deleted, its CBR backups are not deleted.

● Example request
```
DELETE https://{Endpoint}/v2/images/4ca46bf1-5c61-48ff-b4f3-0ad4e5e3ba90
{
    "delete_backup": true
}
```

Response

● Response parameters

None

● Example response
```
STATUS CODE 204
```

Returned Values

● Normal

204

● Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.1.6 Creating Image Metadata (Native OpenStack API)

Function

This API is used to create image metadata.

After the API is successfully invoked, the image metadata is created, but the image file does not exist yet.

URI

POST /v2/images

Request

- Request parameters

Parameter	Mandatory	Type	Description
__os_version	No	String	Specifies the image OS version. For the value range, see **Values of Related Parameters**. If this parameter is not specified, the value **Other Linux(64 bit)** will be used. In that case, the ECS creation using this image may fail, and the ECS created using this image may fail to run properly.
visibility	No	String	Specifies whether the image is available to other tenants. The default value is **private**. When creating image metadata, the value of **visibility** can be set to **private** only.

Parameter	Mandatory	Type	Description
name	No	String	Specifies the image name. If this parameter is not specified, its value is empty by default. In that case, ECS creation using this image will fail. The name contains 1 to 255 characters. For detailed description, see **Image Attributes**. This parameter is left blank by default.
protected	No	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The default value is **false**.
container_format	No	String	Specifies the container format. The default value is **bare**.
disk_format	No	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
tags	No	Array of strings	Lists the image tags. The tag contains 1 to 255 characters. The value is left blank by default.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on ECS specifications. The default value is **0**.

Parameter	Mandatory	Type	Description
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB. The value of this parameter must be greater than the image system disk capacity. Otherwise, the ECS creation may fail.

☐ **NOTE**

Parameters in the request body are strings of no more than 255 characters, and their values can be left blank. Example:

```
"key": "value"
```

- Example request
POST https://{Endpoint}/v2/images
```
{
    "__os_version": "Ubuntu 14.04 server 64bit",
    "container_format": "bare",
    "disk_format": "vhd",
    "min_disk": 1,
    "min_ram": 1024,
    "name": "test",
    "tags": [
        "test",
        "image"
    ],
    "visibility": "private",
    "protected": false
}
```

Response

- Response parameters

Parameter	Type	Description
visibility	String	Specifies whether the image is available to other tenants. The value is **private**.

Parameter	Type	Description
name	String	Specifies the image name. If this parameter is not specified, its value is empty by default. In that case, ECS creation using this image will fail. The name contains 1 to 128 characters. For detailed description, see **Image Attributes**.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value is **false**.
container_format	String	Specifies the container format. The value is **bare**.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
tags	Array of strings	Lists the image tags. The tag contains 1 to 255 characters.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications limit. The value is generally set to **0**.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 40 GB to 255 GB. It must be greater than the system disk capacity in the image. Otherwise, the ECS creation may fail.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: ● **queued**: indicates that the image metadata has already been created, and it is ready for the image file to upload. ● **saving**: indicates that the image file is being uploaded to the backend storage. ● **deleted**: indicates that the image has been deleted. ● **killed**: indicates that an error occurs on the image uploading. ● **active**: indicates that the image is available for use.
created_at	String	Specifies the time when the image was created. The value is in UTC format.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
self	String	Specifies the image URL.
id	String	Specifies the image ID. After the image creation API is called, the image ID must be saved. The image ID is used to invoke the image uploading API and upload the image.
file	String	Specifies the URL for uploading and downloading the image file.
schema	String	Specifies the URL for accessing the schema.
__image_source_type	String	Specifies the image backend storage type. Only UDS is supported currently.
__image_size	String	Specifies the image size. The unit is byte.

Parameter	Type	Description
__isregistered	String	Specifies whether the image is registered. Only registered images can be queried on the portal. The value is **true**.
__os_version	String	Specifies the image OS version. For the value range, see **Values of Related Parameters**.
__os_type	String	Specifies the image OS type. The value of this parameter depends on that of **__os_version**. The value can be **Windows**, **Linux**, or **other**.
__platform	String	Specifies the OS platform supported by the image. The value of this parameter depends on that of **__os_version**.
__os_bit	String	Specifies the OS bit. The value of this parameter depends on that of **__os_version**. The value can be **32** or **64**.
__imagetype	String	Specifies the image type. **private** indicates a private image.
virtual_env_type	String	Specifies the platform type. Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. ● For an ECS image, the value is **FusionCompute**. ● For a data disk image, the value is **DataImage**. ● For a BMS image, the value is **Ironic**. ● For an ISO image, the value is **IsoImage**.
owner	String	Specifies the ID of the project to which the image belongs.

Parameter	Type	Description
__root_origin	String	Specifies that the image is created from an external image file. Value: **file**
checksum	String	Specifies the MD5 value of the image file.
size	Long	This parameter is unavailable currently.
virtual_size	Integer	Specifies the virtual size of the image. The unit is byte.
properties	Properties object	Specifies a collection of image attributes instead of a specified attribute.

6.1.7 Deleting an Image (Native OpenStack API v1.1 - Abandoned and Not Recommended)

Function

This API is used to delete an image. If you soft delete the image with a specified ID, the image persists in the database, but in the **deleted** status.

This API has been discarded. **Deleting an Image (Native OpenStack API)** is recommended.

URI

DELETE /v1.1/images/{image_id}

Table 6-11 lists the parameters in the URI.

Table 6-11 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

Request

- Request parameters

  None

- Example request
  ```
  DELETE https://{Endpoint}/v1.1/images/3c3d1d01-b48a-4639-8a88-08be3b9b5d78
  ```

Response

- Response parameters

  None

- Example response
  ```
  HTTP/1.1 200 OK
  ```

Returned Values	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.1.8 Querying Image Metadata (Native OpenStack API v1 - Abandoned and Not Recommended)

Function

This API is used to query image metadata.

This API has been discarded. The API for querying image details (**Querying Image Details (Native OpenStack API)**) is recommended.

URI

HEAD /v1/images/{image_id}

Table 6-12 lists the parameters in the URI.

Table 6-12 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

Request

- Request parameters

  None

- Example request
  HEAD https://{Endpoint}/v1/images/3c3d1d01-b48a-4639-8a88-08be3b9b5d78

Response

- Response parameters

Parameter	Type	Description
Status	String	Image status
Virtual_size	Integer	Virtual size of an image
Name	String	Image name
Deleted	Boolean	Whether an image has been deleted
Container_format	String	Image container type
Created_at	String	Time when an image was created
Disk_format	String	Image file type
Updated_at	String	Time when an image was updated
Property	Object	Image attribute
Owner	String	Tenant to which an image belongs
Protected	Boolean	Whether an image is protected
Min_ram	Integer	Minimum memory (MB) required for running an image
Checksum	String	Image verification sum. This parameter is available after an image file is uploaded.
Min_disk	Integer	Minimum disk capacity (GB) required for running the image
Is_public	Boolean	Whether an image is a public one
Deleted_at	String	Time when an image was deleted
Id	String	Image UUID

Parameter	Type	Description
Size	Integer	Image size. This parameter is available after an image file is uploaded.

These parameters are contained in the header of the HTTP response message.

- Example response

```

6.1.9 Querying Image Details (Native OpenStack API v1.1 - Abandoned and Not Recommended)

Function

This API is used to query details of images.

This API has been discarded. The image query API (**Querying Images (Native OpenStack API)**) is recommended.

URI

GET /v1.1/images/detail

Request

- Request parameters

  Parameters **name**, **container_format**, **disk_format**, **status**, **size_min**, **size_max**, and **changes-since** can be used to filter the query result.

Parameter	Mandatory	Type	Description
name	No	String	Specifies the image name. For detailed description, see **Image Attributes**.
container_format	No	String	Image container type
disk_format	No	String	Image file format
status	No	String	Image status
size_min	No	String	Minimum size of the image
size_max	No	String	Maximum size of the image
changes-since	No	String	Last update time

- Example request
  GET https://{Endpoint}/v1.1/images/detail?disk_format=qcow2

Response

- Response parameters

Parameter	Type	Description
status	String	Image status
virtual_size	Integer	Virtual size of an image

Parameter	Type	Description
name	String	Specifies the image name. For detailed description, see **Image Attributes**.
deleted	Boolean	Whether an image has been deleted
container_format	String	Image container type
created_at	String	Time when an image was created
disk_format	String	Image file type
updated_at	String	Time when an image was updated
properties	Object	Image attribute
owner	String	Tenant to which an image belongs
protected	Boolean	Whether an image is protected
min_ram	Integer	Minimum memory (MB) required for running an image
checksum	String	Image verification sum. This parameter is available after an image file is uploaded.
min_disk	Integer	Minimum disk capacity (GB) required for running the image
is_public	Boolean	Whether an image is a public one
deleted_at	String	Time when an image was deleted
id	String	Image UUID
size	Integer	Image size. This parameter is available after an image file is uploaded.

- Example response
  HTTP/1.1 200 OK

```

6.2 Image Schema (Native OpenStack APIs)

6.2.1 Querying an Image Schema (Native OpenStack API)

Function

This API is used to query the image schema, which allows you to view image attributes and their data types.

URI

GET /v2/schemas/image

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2/schemas/image

Response

- Response parameters

Parameter	Type	Description
additionalProperties	Object	Specifies the additional attributes. For details, see **Table 6-13**.
name	String	Specifies the schema name.
links	Array of objects	Specifies the URL for accessing the schema. For details, see **Table 6-14**.
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see **Image Attributes**.

Table 6-13 Data structure description of the additionalProperties field

Parameter	Type	Description
type	String	Type

Table 6-14 Data structure description of the links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response

  STATUS CODE 200

  ```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.2.2 Querying an Image List Schema (Native OpenStack API)

Function

This API is used to query an image list schema, which allows you to know details about and the data structure of the image list.

URI

GET /v2/schemas/images

Request

- Request parameters

  None

- Example request
  ```
  GET https://{Endpoint}/v2/schemas/images
  ```

Response

- Response parameters

Parameter	Type	Description
name	String	Specifies the schema name.
links	Array of objects	Specifies the URL for accessing the schema. For details, see **Table 6-15**.
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see **Image Attributes**.

Table 6-15 Data structure description of the links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response
  STATUS CODE 200

```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.2.3 Querying an Image Member Schema (Native OpenStack API)

Function

This API is used to query an image member schema, which allows you to view image member attributes and their data types.

URI

GET /v2/schemas/member

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2/schemas/member

Response

- Response parameters

Parameter	Type	Description
name	String	Specifies the schema name.
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see **Image Attributes**.

- Example response

```
STATUS CODE 200
{
    "name": "member",
    "properties": {
        "status": {
            "enum": [
                "pending",
                "accepted",
                "rejected"
            ],
            "type": "string",
            "description": "The status of this image member"
        },
        "created_at": {
            "type": "string",
            "description": "Date and time of image member creation"
        },
        "updated_at": {
            "type": "string",
            "description": "Date and time of last modification of image member"
        },
        "image_id": {
            "pattern": "^([0-9a-fA-F]){8}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-([0-9a-fA-F])
```

```
{12}$",
        "type": "string",
        "description": "An identifier for the image"
    },
    "member_id": {
        "type": "string",
        "description": "An identifier for the image member (tenantId)"
    },
    "schema": {
        "readOnly": true,
        "type": "string"
    }
  }
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.2.4 Querying an Image Member List Schema (Native OpenStack API)

Function

This API is used to query an image member list schema, which allows you to view image member attributes and their data types.

URI

GET /v2/schemas/members

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2/schemas/members

Response

- Response parameters

Parameter	Type	Description
name	String	Specifies the schema name.
links	Array of objects	Specifies the URL for accessing the schema. For details, see **Table 6-16**.
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see **Image Attributes**.

Table 6-16 Data structure description of the links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response
```
STATUS CODE 200
{
    "name": "members",
    "links": [
        {
            "href": "{schema}",
            "rel": "describedby"
        }
    ],
    "properties": {
        "members": {
            "items": {
                "name": "member",
                "properties": {
                    "status": {
                        "enum": [
                            "pending",
                            "accepted",
                            "rejected"
                        ],
                        "type": "string",
                        "description": "The status of this image member"
                    },
                    "created_at": {
                        "type": "string",
                        "description": "Date and time of image member creation"
                    },
                    "updated_at": {
                        "type": "string",
                        "description": "Date and time of last modification of image member"
                    },
                    "image_id": {
```

```
                          "pattern": "^([0-9a-fA-F]){8}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-
            ([0-9a-fA-F]){12}$",
                          "type": "string",
                          "description": "An identifier for the image"
                      },
                      "member_id": {
                          "type": "string",
                          "description": "An identifier for the image member (tenantId)"
                      },
                      "schema": {
                          "readOnly": true,
                          "type": "string"
                      }
                  }
              },
              "type": "array"
          },
          "schema": {
              "type": "string"
          }
      }
   }
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.3 Image Sharing (Native OpenStack APIs)

6.3.1 Adding an Image Member (Native OpenStack API)

Function

This API is used to add a project ID of a tenant with whom the image is to be shared.

URI

POST /v2/images/{image_id}/members

Request

- Request parameters

Parame ter	Mandatory	Type	Description
membe r	Yes	String	Specifies the image member. The value is the project ID of a tenant.

- Example request

```
POST https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members
{
    "member":"edc89b490d7d4392898e19b2deb34797"
}
```

Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the member ID, that is, the project ID of the tenant who is to accept the shared image.
schema	String	Specifies the sharing schema.

- Example response

```
STATUS CODE 200
{
    "status": "pending",
    "created_at": "2016-09-01T02:05:14Z",
    "updated_at": "2016-09-01T02:05:14Z",
    "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
    "member_id": "edc89b490d7d4392898e19b2deb34797",
    "schema": "/v2/schemas/member"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.3.2 Updating the Image Sharing Status in Batches (Native OpenStack API)

Function

This API is used to update the image sharing status when a tenant accepts or rejects a shared image.

URI

PUT /v2/images/{image_id}/members/{member_id}

Table 6-17 lists the parameters in the URI.

Table 6-17 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
member_id	Yes	String	Specifies the member ID.

Request

- Request parameters

Parameter	Mandatory	Type	Description
status	Yes	String	Specifies whether a shared image will be accepted or declined. Available values include: ● **accepted**: indicates that a shared image is accepted. After an image is accepted, the image is displayed in the image list. You can use the image to create ECSs. ● **rejected**: indicates that a shared image is declined. After an image is rejected, the image is not displayed in the image list. However, you can still use the image to create ECSs.
vault_id	Yes	String	Specifies the vault ID. You can obtain the vault ID from the CBR console or section "Querying the Vault List" in *Cloud Backup and Recovery API Reference*.

- Example request
  - If the image is not a full-ECS image:
    ```
    PUT https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/
    members/edc89b490d7d4392898e19b2deb34797
    {
        "status": "accepted"
    }
    ```
  - If the image is a full-ECS image:
    ```
    PUT https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/
    members/edc89b490d7d4392898e19b2deb34797
    {
        "status": "accepted",
        "vault_id": "6yhtb5df-1bc3-4c3f-893e-3e4716yhgt61"
    }
    ```

Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.

Parameter	Type	Description
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the member ID.
schema	String	Specifies the sharing schema.

- Example response
  STATUS CODE 200
  ```
  {
      "status": "accepted",
      "created_at": "2016-09-01T02:05:14Z",
      "updated_at": "2016-09-01T02:37:11Z",
      "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
      "member_id": "edc89b490d7d4392898e19b2deb34797",
      "schema": "/v2/schemas/member"
  }
  ```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.3.3 Querying Image Member Details (Native OpenStack API)

Function

This API is used to query details about a tenant with whom the image is shared.

URI

GET /v2/images/{image_id}/members/{member_id}

Table 6-18 lists the parameters in the URI.

Table 6-18 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
member_id	Yes	String	Specifies the member ID.

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members/
  edc89b490d7d4392898e19b2deb34797

Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the member ID.
schema	String	Specifies the sharing schema.

- Example response

  STATUS CODE 200
  ```
  {
      "status": "accepted",
      "created_at": "2016-09-01T02:05:14Z",
      "updated_at": "2016-09-01T02:37:11Z",
      "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
      "member_id": "edc89b490d7d4392898e19b2deb34797",
      "schema": "/v2/schemas/member"
  }
  ```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.3.4 Querying Image Members (Native OpenStack API)

Function

This API is used to query the tenants with whom an image is shared using search criteria and to display the tenants in a list.

URI

GET /v2/images/{image_id}/members

Table 6-19 lists the parameters in the URI.

Table 6-19 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members

Response

- Response parameters

Parameter	Type	Description
members	Array of objects	Specifies the members. For details, see **Table 6-20**.
schema	String	Specifies the sharing schema.

Table 6-20 Data structure description of the members field

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the member ID.
schema	String	Specifies the sharing schema.

- Example response
```
STATUS CODE 200
{
    "members": [
        {
            "status": "accepted",
            "created_at": "2016-09-01T02:05:14Z",
            "updated_at": "2016-09-01T02:37:11Z",
            "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
            "member_id": "edc89b490d7d4392898e19b2deb34797",
            "schema": "/v2/schemas/member"
        }
    ],
    "schema": "/v2/schemas/members"
}
```

Returned Values

- Normal

  200

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.3.5 Deleting an Image Member (Native OpenStack API)

Function

This API is used to stop image sharing by deleting the tenant with whom the image is shared.

URI

DELETE /v2/images/{image_id}/members/{member_id}

Table 6-21 lists the parameters in the URI.

Table 6-21 Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
member_id	Yes	String	Specifies the member ID.

Request

- Request parameters

  None
- Example request

  DELETE https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members/
  edc89b490d7d4392898e19b2deb34797

Response

- Response parameters

  None
- Example response

  204 No Content

Returned Values

- Normal

  204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.

Returned Value	Description
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.4 API Version Query (Native OpenStack API)

6.4.1 Querying API Versions (Native OpenStack API)

Function

This API is used to query API versions, such as version compatibility and domain name information of APIs.

URI

GET /

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/

Response

- Response parameters

Parameter	Type	Description
versions	Array of objects	Specifies the versions. For details, see **Table 6-22**.

Table 6-22 Data structure description of the versions field

Parameter	Type	Description
status	String	Specifies the API status.
id	String	Specifies the API ID.
links	Array of objects	Specifies the description. For details, see **Table 6-23**.

Table 6-23 Data structure description of the versions.links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response
  STATUS CODE 300
```
{
   "versions": [
      {
         "status": "CURRENT",
         "id": "v2.2",
         "links": [
            {
               "href": "https://image.az1.dc1.domainname.com/v2/",
               "rel": "self"
            }
         ]
      },
      {
         "status": "SUPPORTED",
         "id": "v2.1",
         "links": [
            {
               "href": "https://image.az1.dc1.domainname.com/v2/",
               "rel": "self"
            }
         ]
      },
      {
         "status": "SUPPORTED",
         "id": "v2.0",
         "links": [
            {
               "href": "https://image.az1.dc1.domainname.com/v2/",
               "rel": "self"
            }
         ]
      },
      {
         "status": "DEPRECATED",

            {
               "href": "https://image.az1.dc1.domainname.com/v1/",
               "rel": "self"
            }
         ]
```

```
        }
    ]
}
```

Returned Values

- Normal

  300

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

6.4.2 Querying an API Version (Native OpenStack API)

Function

This API is used to query a specified API version, such as version compatibility and domain name information of an API.

URI

GET /{api_version}

Table 6-24 lists the parameters in the URI.

Table 6-24 Parameter description

Parameter	Mandatory	Type	Description
api_version	Yes	String	Specifies the API version, for example v2.0.

Request

- Request parameters

  None

- Example request

  GET https://{Endpoint}/v2.0

Response

- Response parameters

Parameter	Type	Description
versions	Array of objects	Specifies the version. For details, see **Table 6-25**.

Table 6-25 Data structure description of the versions field

Parameter	Type	Description
status	String	Specifies the API status.
id	String	Specifies the API ID.
links	Array of objects	Specifies the description. For details, see **Table 6-26**.

Table 6-26 Data structure description of the versions.links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response
  STATUS CODE 300
```
{
    "versions": [
        {
            "status": "SUPPORTED",
            "id": "v2.0",
            "links": [
                {
                    "href": "https://image.az1.dc1.domainname.com/v2/",
                    "rel": "self"
                }
            ]
        }
    ]
}
```

Returned Values

- Normal

  300

- Abnormal

Returned Values	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

<div align="right">

7 Examples

</div>

7.1 Creating an Image from an ISO File

Scenarios

An ISO file is a disk image of an optical disc. A large number of data files can be compressed into a single ISO file. Likewise, to access the files stored in an ISO, the ISO file needs to be decompressed. For example, you can use a virtual CD-ROM to open an ISO file, or burn the ISO file to a CD or DVD and then use the CD-ROM to read the image.

This section describes how to use APIs to create a private image from an ISO file.

Involved APIs

If you use a token for authentication, you must obtain the token and add **X-Auth-Token** to the request header of the IMS API when making an API call.

- IAM API used to obtain the token

  URI format: POST https://*IAM endpoint*/v3/auth/tokens
- IMS API used to create a private image using an image file uploaded to the OBS bucket

  URI format: POST https://*IMS endpoint*/v2/cloudimages/action
- ECS API used to create an ECS

  URI format: POST https://*ECS endpoint*/v1/*project_id*/cloudservers
- IMS API used to create a system disk image from a data disk

  URI format: POST https://*IMS endpoint*/v2/cloudimages/action

Procedure

1. Obtain the token by referring to **Authentication**.
2. Create a private image using an ISO image file uploaded to the OBS bucket.

   a. Send **POST https://***IMS endpoint***/v2/cloudimages/action**.

b. Add **X-Auth-Token** to the request header.

c. Set the following parameters in the request body:

For details about the parameters, see **Creating an Image**.

```
{
    "name": "ims_test_file",  //Image name (mandatory, string)
    "description": "Image creation using an image file uploaded to the OBS bucket",  //Image
description (optional, string)
    "image_url": "ims-image:centos70.iso",  //Image file address (mandatory, string)
    "os_type": "Linux", //OS type (optional, string)
    "os_version": "CentOS 7.0 64bit",  //OS version (mandatory, string)
    "type": "IsoImage", //Image type (mandatory, string)
    "min_disk": 40,  //Minimum system disk space (mandatory, integer)
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]  //Image tags
(optional, array of objects)
}
```

d. Obtain the image ID by querying job details based on the returned **job_id**. For details, see **Asynchronous Job Query**.

3. Create a temporary ECS from the ISO image.

📖 **NOTE**

- You can select only a general-computing flavor with 2 vCPUs, 4 GB or more memory, and KVM virtualization type.
- You need to create a system disk and a data disk for the ECS. The OS will be installed on the data disk by default.

a. Send **POST https://***ECS endpoint***/v1/***project_id***/cloudservers**.

b. Add **X-Auth-Token** to the request header.

c. Set the following parameters in the request body:

The following parameters are all mandatory. For details about the parameters, see "Creating an ECS" in *Elastic Cloud Server API Reference*.

```
{
    "server": {
        "imageRef": "fac42d61-ea1e-4271-94ba-6543a852d2c6", //Image ID
        "flavorRef": "rc6.large.2_manage",
        "name": "instance-test",
        "vpcid": "18ec99f0-7159-4d7b-ad27-f32315d5af61",
        "nics": [{
            "subnet_id": "81a4ecb0-0451-4c60-8373-8b923238ec40"
        }],
        "root_volume": {
            "volumetype": "SATA",
            "size": "40"
        },
        "data_volumes": [{
            "volumetype": "SATA",
            "size": "40"
        }],
        "availability_zone": "az-1a",
        "metadata": {
            "virtual_env_type": "IsoImage"
        },
        "extendparam": {
            "diskPrior": "true"
        }
    }
}
```

d. Obtain the ECS ID by querying job details based on the returned **job_id**. For details, see "Querying Task Execution Status" in *Elastic Cloud Server API Reference*.

       e.   Query ECS details based on the ECS ID to obtain the data disk ID (**volume_id**) required in **4**. For details, see "Querying Details About an ECS" in *Elastic Cloud Server API Reference*.

4. Use the temporary ECS to create a standard private image.

       a.   Send **POST https://***IMS endpoint***/v2/cloudimages/action**.

       b.   Add **X-Auth-Token** to the request header.

       c.   Set the following parameters in the request body:

           For details about the parameters, see **Creating an Image**.

```
{
    "name": "ims_test",  //Image name (a mandatory string)
    "description": "Creating a system disk image from a data disk", //Image description (optional, string)
    "volume_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a", //Data disk ID (mandatory, string)
    "type": "ECS", //Image type (mandatory, string)
    "os_version": "CentOS 7.0 64bit",  //OS version (mandatory, string)
    "image_tags": [{"key":"key2","value":"value2"},{"key":"key1","value":"value1"}]  //Image tags (optional, array of objects)
}
```

       d.   Obtain the image ID by querying job details based on the returned **job_id**. For details, see **Asynchronous Job Query**.

8 Permission Policies and Supported Actions

8.1 Introduction

This section describes fine-grained permissions management for your IMS. If your account does not need individual IAM users, you may skip over this section.

By default, new IAM users do not have any permissions assigned. You need to add a user to one or more groups, and assign policies or roles to these groups. The user then inherits permissions from the groups it is a member of. This process is called authorization. After authorization, the user can perform specified operations on cloud services based on the permissions.

You can grant user permissions by using roles and policies.

- Roles: A type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. This mechanism provides only a limited number of service-level roles for authorization.

- Policies: A type of fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. This mechanism allows for API-level policies for authorization, meeting requirements for secure access control.

◻ NOTE

Policy-based authorization is useful if you want to allow or deny the access to an API.

An account has all of the permissions required to call all APIs, but IAM users must have the required permissions specifically assigned. The permissions required for calling an API are determined by the actions supported by the API. Only users who have been granted permissions allowing the actions can call the API successfully. For example, if an IAM user queries images using an API, the user must have been granted permissions that allow the **ims:images:list** action.

Supported Actions

IMS provides system-defined policies. You can also create custom policies for more specific access control. The following are related concepts:

- Permissions: Allow or deny certain operations.

- APIs: APIs that will be called for performing certain operations.

- Actions: Operations that will be allowed or denied.

- Dependent actions: When assigning permissions for an action, you also need to assign permissions for the dependent actions.

- IAM projects or enterprise projects: Applicable scope of custom policies. For example, if an action supports both IAM and enterprise projects, the policy that contains this action will take effect for user groups assigned in IAM and Enterprise Management. If an action supports only IAM projects, the policy will take effect only for user groups assigned in IAM.

☐ NOTE

√: supported; x: not supported

IMS supports the following actions that can be defined in custom policies:

- **Image Management**, including actions supported by IMS's image management APIs, such as the APIs for querying images, updating image information, creating images, registering images, and exporting images.

- **Image Schema**, including actions supported by IMS's image schema management APIs, such as the APIs for querying an image schema, querying an image list schema, querying an image member schema, and query an image member list schema.

- **Image Sharing**, including actions supported by IMS's shared image APIs, such as the APIs for adding an image member, updating the status of image members, querying image member details, and deleting an image member.

- **Image Replication**, including actions supported by IMS's image replication APIs, such as the API for replicating an image within a region.

- **Image Quota**, including actions supported by IMS's image quota APIs, such as the API for querying image quotas.

☐ NOTE

Error messages returned for native OpenStack APIs are in XML format. JSON format of the fine-grained policy is not supported.

8.2 Image Management

Permissions	APIs	Actions	IAM Project	Enterprise Project
Querying Images	GET /v2/cloudimages	ims:images:list	√	√

Permissions	APIs	Actions	IAM Project	Enterprise Project
Updating Image Information	PATCH /v2/cloudimages/{image_id}	• ims:images:update • ims:serverImages:create (only for migration to enterprise projects)	√	√
Creating an Image	POST /v2/cloudimages/action **NOTE** Before creating an image using an external image file, ensure that you have the Tenant Administrator permission for OBS.	ims:serverImages:create	√	√
Importing an Image File Quickly	POST /v2/cloudimages/quickimport/action **NOTE** Before quickly importing an image file, ensure that you have the Tenant Administrator permission for OBS.	• ims:serverImages:create (required only for quickly importing system disk images) • ims:dataImages:create (required only for quickly importing data disk images)	√	√
Creating a Data Disk Image Using an External Image File	POST /v1/cloudimages/dataimages/action **NOTE** Before using an external image file, ensure that you have the Tenant Administrator permission for OBS.	ims:dataImages:create	√	√

Permissions	APIs	Actions	IAM Project	Enterprise Project
Creating a Full-ECS Image	POST /v1/ cloudimages/ wholeimages/action **NOTE** Before creating a full-ECS image, ensure that you have the CBR Admin permission of the CBR service.	ims:wholeImages: create	√	√
Registering an Image	PUT /v1/ cloudimages/ {image_id}/upload **NOTE** Before registering an image file, ensure that you have the Tenant Administrator permission for OBS.	ims:images:upload	√	√
Exporting an Image	POST /v1/ cloudimages/ {image_id}/file **NOTE** Before exporting an image, ensure that you have the Tenant Administrator permission for OBS.	ims:images:export	√	√
Querying Images (Native OpenStack API)	GET /v2/images	ims:images:list	√	x
Querying Image Details (Native OpenStack API)	GET /v2/images/ {image_id}	ims:images:get	√	√
Updating Image Information (Native OpenStack API)	PATCH /v2/images/ {image_id}	ims:images:update	√	√

Permissions	APIs	Actions	IAM Project	Enterprise Project
Deleting an Image (Native OpenStack API)	DELETE /v2/images/{image_id}	ims:images:delete	√	√
Creating Image Metadata (Native OpenStack API)	POST /v2/images	ims:images:create	√	x
Uploading an Image (Native OpenStack API)	PUT /v2/images/{image_id}/file	- ims:images:get - ims:images:update - ims:images:upload	√	x
Querying the API Version (Native OpenStack API)	GET /	N/A	√	x
Querying Image Details (Native OpenStack API v1.1 - Abandoned and Not Recommended)	GET /v1.1/images/detail	ims:images:list	√	x
Querying Image Metadata (Native OpenStack API v1 - Abandoned and Not Recommended)	HEAD /v1/images/{image_id}	ims:images:get	√	x

Permissions	APIs	Actions	IAM Project	Enterprise Project
Deleting an Image (Native OpenStack API V1.1, Abandoned and Not Recommended)	DELETE /v1.1/images/{image_id}	ims:images:delete	√	x

8.3 Image Schema

Permissions	APIs	Actions	IAM Project	Enterprise Project
Querying an Image Schema (Native OpenStack API)	GET /v2/schemas/image	N/A	√	x
Querying an Image List Schema (Native OpenStack API)	GET /v2/schemas/images	N/A	√	x
Querying an Image Member Schema (Native OpenStack API)	GET /v2/schemas/member	N/A	√	x

Permissi ons	APIs	Actions	IAM Project	Enterpris e Project
Querying an Image Member List Schema (Native OpenStac k API)	GET /v2/schemas/ members	N/A	√	x

8.4 Image Sharing

Permissio ns	APIs	Actions	IAM Project	Enterpris e Project
Adding an Image Member (Native OpenStac k API)	POST /v2/images/ {image_id}/members	• ims:images:ge t • ims:images:sh are	√	x
Updating the Image Sharing Status in Batches (Native OpenStac k API)	PUT /v2/images/ {image_id}/members/ {member_id}	• ims:images:ge t • ims:images:sh are	√	x
Querying Image Member Details (Native OpenStac k API)	GET /v2/images/ {image_id}/members/ {member_id}	• ims:images:ge t • ims:images:sh are	√	x
Querying Image Members (Native OpenStac k API)	GET /v2/images/ {image_id}/members	• ims:images:ge t • ims:images:sh are	√	x

Permissions	APIs	Actions	IAM Project	Enterprise Project
Deleting an Image Member (Native OpenStack API)	DELETE /v2/images/{image_id}/members/{member_id}	• ims:images:get • ims:images:share	√	x
Adds image members.	POST /v1/cloudimages/members	ims:images:share	√	x
Updates the status of image members in batches.	PUT /v1/cloudimages/members	ims:images:share	√	x
Deletes image members in batches.	DELETE /v1/cloudimages/members	ims:images:share	√	x

8.5 Image Replication

Permissions	APIs	Actions	IAM Project	Enterprise Project
Replicating an Image Within a Region	POST /v1/cloudimages/{image_id}/copy	• ims:images:copy • ims:serverImages:create (required only for users who have enabled the enterprise project)	√	√
Replicating an Image Across Regions	POST /v1/cloudimages/{image_id}/cross_region_copy	ims:images:copy	√	x

8.6 Image Quota

Permissions	APIs	Actions	IAM Project	Enterprise Project
Queries the image quota	GET /v1/ cloudimages/quota	ims:quotas:get	√	√

9 Common Parameters

9.1 Image Attributes

Description

An image is an ECS template containing mandatory software, such as an OS. The template may also contain application software, such as database software, and proprietary software. Image is the core object of IMS.

Image Attributes

Name	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.
status	String	Specifies the image status. The value can be **active**, **queued**, **saving**, **deleted**, or **killed**. An image can be used only when it is in the **active** state.
tags	Array of strings	Lists the image tags.
visibility	String	Specifies whether the image can be seen by other tenants. The value can be **private**, **public**, or **shared**.

Name	Type	Description
name	String	Specifies the image name. ● The name cannot start or end with a space. ● The name contains 1 to 128 characters. ● The name contains the following characters: – Uppercase letters – Lowercase letters – Digits – Special characters, including hyphens (-), periods (.), underscores (_), and space
checksum	String	This parameter is unavailable currently.
deleted	Boolean	Specifies whether the image has been deleted. The value can be **true** or **false**.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be **true** or **false**.
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. The default value is **0**.
update_at	String	Specifies the time when the image was updated.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Provides supplementary information about the image. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed.
disk_format	String	Specifies the image format. The value can be **zvhd2**, **vhd**, **zvhd**, **raw**, **iso**, or **qcow2**. The default value is **zvhd2** for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be **true** or **false**.

Name	Type	Description
__platform	String	Specifies the image platform type. The value can be **Windows**, **Ubuntu**, **Red Hat**, **SUSE**, **CentOS**, **Debian**, **OpenSUSE**, **Oracle Linux**, **Fedora**, **Other**, **CoreOS**, or **EulerOS**.
__os_type	String	Specifies the OS type. The value can be **Linux**, **Windows**, or **Other**.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image.
virtual_env_type	String	Specifies the environment where the image is used. The value can be **FusionCompute**, **Ironic**, **DataImage**, or **IsoImage**. ● For an ECS image (system disk image), the value is **FusionCompute**. ● For a data disk image, the value is **DataImage**. ● For a BMS image, the value is **Ironic**. ● For an ISO image, the value is **IsoImage**.
__image_source_type	String	Specifies the image backend storage type. Only UDS is supported currently.
__imagetype	String	Specifies the image type. The following types are supported: ● Public image: The value is **gold**. ● Private image: The value is **private**. ● Shared image: The value is **shared**.
__whole_image	Boolean	Specifies whether the image is a full-ECS image. The value can be **true** or **false**.
create_at	String	Specifies the time when the image was created.
virtual_size	Integer	This parameter is unavailable currently.
deleted_at	String	Specifies the time when the image was deleted.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. To create an image using a backup, set the value to the backup ID. Otherwise, this value is left empty.
__image_location	String	Specifies the location where the image is stored.

Name	Type	Description
__image_size	String	Specifies the size (bytes) of the image file.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
hw_firmware_type	String	Specifies the ECS boot mode. The following values are supported: ● **bios** indicates the BIOS boot mode. ● **uefi** indicates the UEFI boot mode.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is **true**. Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is **true**. Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. For the supported OSs, see **Table 9-2**. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with __**support_xen** and __**support_kvm**.
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See **Table 9-3** for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with __**support_xen** and __**support_kvm**.

Name	Type	Description
__is_config_init	String	Specifies whether initial configuration is complete. The value can be **true** or **false**. If initial configuration is complete, the value is set to **true**. Otherwise, the value is set to **false**. The default value is **false**.

9.2 Image Tag Data Formats

Description

You can attach a custom tag to a private image to facilitate private image management.

Data Formats

Data format of **tag**

- The data format is *key.value*. If a key is added, a tag is added. In other cases, the tag is modified.

- When the tag contains multiple decimal points, the content before the first decimal point is the key, and that after the first decimal point is the value. If the content after the first decimal point still contains decimal points, the content as a whole is considered as the value. If the tag contains no decimal point, the value is regarded as an empty character string.

- The tag key can contain a maximum of 36 characters, and the tag value can contain a maximum of 43 characters. The tag value can be an empty character string.

- The tag key can only consist of digits, letters, underscores (_), and hyphens (-).

- The tag key must be unique and cannot be empty.

- The tag value can only consist of digits, letters, underscores (_), periods (.), and hyphens (-).

Data format of **image_tags**

- The data format is *{"key": "keyA", "value": "valueA"}*. If the added key A exists, the tag is updated.

- The tag key can contain a maximum of 36 characters, and the tag value can contain a maximum of 43 characters. The tag value can be an empty character string.

- The tag key can only consist of digits, letters, underscores (_), and hyphens (-).

- The tag key must be unique and cannot be empty.

- The tag value can only consist of digits, letters, underscores (_), periods (.), and hyphens (-).

Data Formats (Native OpenStack)

Data format of **tag**

- The data format is *key*. If a key is added, a tag is added. In other cases, the tag is modified.

- The tag key can contain a maximum of 255 characters.

- The character string cannot contain equal signs (=).

9.3 Restrictions on Image Sharing

Description

You can use the image sharing function to share your private images with other users.

Constraints

- Images can only be shared within a region.

- A system disk image or data disk image can be shared with a maximum of 128 tenants, and a full-ECS image can be shared with a maximum of 10 tenants.

- You can stop sharing images anytime without notifying the recipient.

- You can delete shared image anytime without notifying the recipient.

- Encrypted images cannot be shared.

- Only full-ECS images created from CBR backups can be shared. Full-ECS images created using other methods cannot be shared.

9.4 Obtaining a Project ID

Scenarios

A project ID is required for some URLs when an API is called. Therefore, you need to obtain a project ID in advance. Two methods are available:

- **Obtain the Project ID by Calling an API**
- **Obtain the Project ID from the Console**

Obtain the Project ID by Calling an API

You can obtain the project ID by calling the IAM API used to query project information based on the specified criteria.

The API used to obtain a project ID is GET https://{Endpoint}/v3/projects. {Endpoint} is the IAM endpoint and can be obtained from **Regions and Endpoints**. For details about API authentication, see **Authentication**.

The following is an example response. The value of **id** is the project ID.

```
{
    "projects": [
```

```
        {
            "domain_id": "65382450e8f64ac0870cd180d14e684b",
            "is_domain": false,
            "parent_id": "65382450e8f64ac0870cd180d14e684b",
            "name": "project_name",
            "description": "",

Obtain a Project ID from the Console

To obtain a project ID from the console, perform the following operations:

1. Log in to the management console.
2. Click the username and select **My Credentials** from the drop-down list.

   On the **My Credentials** page, view the project ID (value in the **Project ID** column).

__support_xen_gpu_type Values

Table 9-2 Supported GPU types

Supported GPU (__support_xen_gpu_type)	Description
M60_vGPU	The image has a hardware virtualization drive with the M60 video card installed and supports **g1.xlarge** and **g1.2xlarge** ECSs.

__support_kvm_gpu_type Values

Table 9-3 Supported GPU types

Supported GPU (__support_kvm_gpu_type)	Description
M60	The image has a hardware virtualization drive with the M60 video card installed and supports **g1.xlarge**, **g1.2xlarge**, and **g3.4xlarge.4** ECSs.
V100_vGPU	The image has a hardware virtualization drive with the V100 video card installed and supports **g5.8xlarge.4** ECSs.
P2V_V100	The image has a hardware virtualization drive with the V100 video card installed and supports **p2v.2xlarge.8** ECSs.
P100	The image has a hardware virtualization drive with the P100 video card installed and supports **p1.2xlarge.8** and **p1.4xlarge.8** ECSs.
V100	The image has a hardware virtualization drive with the V100 video card installed and supports **p2.2xlarge.8** and **p2.4xlarge.8** ECSs.

Special Images and Supported OSs

Table 9-4 Special image types and supported OSs

Image Type	Supported OS

A Status Codes

- Normal

Returned Value	Description
200 OK	The results of GET and PUT operations are returned as expected.
201 Created	The results of the POST operation are returned as expected.
202 Accepted	The request has been accepted for processing.
204 No Content	The results of the DELETE operation are returned as expected.

- Abnormal

Returned Value	Description
400 Bad Request	The server failed to process the request.
401 Unauthorized	You must enter a username and password to access the requested page.
403 Forbidden	You are forbidden to access the requested page.
404 Not Found	The server cannot find the requested page.
405 Method Not Allowed	You are not allowed to use the method specified in the request.
406 Not Acceptable	The response generated by the server cannot be accepted by the client.
407 Proxy Authentication Required	You must use the proxy server for authentication so that the request can be processed.

Returned Value	Description
408 Request Timeout	The request timed out.
409 Conflict	The request could not be processed due to a conflict.
500 Internal Server Error	Failed to complete the request because of a service error.
501 Not Implemented	Failed to complete the request because the server does not support the requested function.
502 Bad Gateway	Failed to complete the request because the request is invalid.
503 Service Unavailable	Failed to complete the request. The service is unavailable.
504 Gateway Timeout	A gateway timeout error occurred.

B Error Codes

Function Description

If the returned status code is **400**, a customized error message will be returned. This section describes the meaning of each status code.

Response Format

```
STATUS CODE 400
{
    "error": {
        "message": "The imagetype is invalid.",
        "code": "IMG.0024"
    }
}
```

Error Message Description

Table B-1 Error codes

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0001	The request message format is invalid.	The request message format is invalid.	Use the correct format.
400	IMG. 0002	The image name contains more than 128 characters.	The image name contains more than 128 characters.	Reduce the length of the image name.
400	IMG. 0003	The image name format is invalid.	The image name format is invalid.	Check whether the image name is valid.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0004	The description contains more than 1024 characters.	The image name contains more than 1024 characters.	Reduce the length of the image description to within 1024 characters.
400	IMG. 0005	The ECS does not exist.	The ECS does not exist.	Check whether the ECS exists.
400	IMG. 0006	The ECS system disk cannot be used to create an image.	The system disk of the ECS cannot be used to create an image.	Check the system disk status of the ECS.
400	IMG. 0007	The request body is empty.	The message body is empty.	Check whether the message body is valid.
400	IMG. 0008	The ECS cannot be used to create images because it is not in stopped state.	The ECS cannot be used to create an image because it is not in the **Stopped** state.	Stop the ECS and try again.
400	IMG. 0009	The image name already exists.	The image name already exists.	Change another image name.
400	IMG. 0010	The ECS cannot be used to create an image because it has in-progress tasks.	The ECS cannot be used to create an image because it has in-progress tasks.	Try again after the tasks are complete.
400	IMG. 0011	**forceCreate** must be set to **true**.	**forceCreate** must be set to **true**.	Set **forceCreate** to **true**.
400	IMG. 0012	The ECS ID is not specified.	The ECS ID is invalid.	Enter a valid ECS ID.
400	IMG. 0013	The image name is not specified.	The image name is not specified.	Enter a valid image name.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG.0014	An exception occurred when IaaS OpenStack was executing the task.	An exception occurred when IaaS OpenStack was executing the task.	Contact technical support.
400	IMG.0015	The number of private images has reached the maximum allowed.	The number of private images has reached the quota.	Increase the quota or delete existing images.
400	IMG.0016	An error occurred when the request body was deleted.	An error occurred when the request body was deleted.	Contact technical support.
400	IMG.0017	The URL format is incorrect.	The URL format is incorrect.	Check whether the URL format is valid.
400	IMG.0018	An error occurred when the job was submitted.	An error occurred when the job was submitted.	Contact technical support.
400	IMG.0019	The backup ID is not specified.	The backup ID is not specified.	Check whether the current backup ID is valid.
400	IMG.0020	The backup does not exist.	The backup does not exist.	Check whether the backup file exists.
400	IMG.0021	The resource type is unknown.	The source type is unknown.	Select a correct source type.
400	IMG.0022	The disk in the current state cannot be used to create images.	A disk in the current state cannot be used to create images.	Check the disk status.
400	IMG.0023	An exception occurred during task query.	An exception occurred during job query.	Contact technical support.
400	IMG.0024	The image type in the request is incorrect.	The image type in the request is incorrect.	Select either BMS or ECS.
400	IMG.0025	The user type in the request is incorrect.	The user type in the request is incorrect.	Check whether the user type is valid.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0026	The role is invalid. You need to apply for the required permissions or pass the real-name authentication.	You do not have the rights to perform the operation.	Contact technical support.
400	IMG. 0027	The image ID in the request does not exist.	The image ID in the request does not exist.	Use a valid image ID.
400	IMG. 0028	The image in the request is protected.	The image in the request is protected.	Contact technical support.
400	IMG. 0029	The backup in the request has already been used to create an image.	The backup in the request has already been used to create an image.	Select another backup that has not been used.
400	IMG. 0030	The project ID and token in the request are invalid.	The project ID and token in the request are invalid.	Enter a correct project ID and token.
400	IMG. 0031	The resource ID in the request is incorrect.	The resource ID in the request is incorrect.	Use a valid image ID.
400	IMG. 0032	The backup is unavailable.	The backup is unavailable.	Check whether the backup is available.
400	IMG. 0033	The backup is not a system disk backup.	The backup is not a system disk backup.	Check whether the backup is a system disk backup.
400	IMG. 0034	The number of images cannot be modified.	The number of images cannot be modified.	Contact technical support.
400	IMG. 0035	An attribute conflict occurred during the modification.	An attribute conflict occurred during the modification.	Contact technical support.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG.0036	An error occurred when the value of **asumeToken** was obtained.	An error occurred when the value of **asumeToken** was obtained.	Contact technical support.
400	IMG.0037	An error occurred in the AK/SK was obtained.	An error occurred in the AK/SK was obtained.	Contact technical support.
400	IMG.0038	An error occurred when the bucket was created.	An error occurred when the bucket was created.	Contact technical support.
400	IMG.0039	An error occurred when read and write permissions of the bucket were granted to a specified user.	An error occurred when read and write permissions of the bucket were granted to a specified user.	Contact technical support.
400	IMG.0040	An error occurred in the object storage address was obtained.	An error occurred in the object storage address was obtained.	Contact technical support.
400	IMG.0041	The authorized account is empty.	The authorized account is empty.	Use a valid account.
400	IMG.0045	Failed to generate the image product code.	Failed to generate the image product code.	Contact technical support.
400	IMG.0046	The image is unavailable.	The image is unavailable.	Check the image status.
400	IMG.0047	This operation can be performed only by the image owner.	This operation can be performed only by the image owner.	Check whether you have the permission to operate the image.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG.0053	An error occurred when the domain information of the shadow account was obtained.	An error occurred when the domain information of the shadow account was obtained.	Contact technical support.
400	IMG.0054	The image description format is invalid.	The image description format is invalid.	Check the image description. It can contain no more than 1024 characters that consist of only letters and digits. Spaces and angle brackets (< >) are not allowed.
400	IMG.0055	The memory or disk size is invalid.	The memory or disk size is invalid.	Check the memory (MB) or disk size (GB) supported by the image.
400	IMG.0056	The OS type is invalid.	The OS type is invalid.	Select Windows or Linux.
400	IMG.0057	The image file does not exist, is empty, or in the incorrect format.	The image file does not exist, is empty, or in the incorrect format.	Select a valid image file.
400	IMG.0058	The region of the bucket where the image file is stored is inconsistent with that of the user.	The region of the bucket where the image file is stored is inconsistent with that of the user.	Ensure that the bucket where the image is stored is in region as the user.
400	IMG.0059	The size of the image file exceeds the maximum allowed.	The size of the image file exceeds the maximum allowed.	Check whether the size of the image file is less than or equal to 128 GB.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0060	The number of tasks exceeds the flow control limit.	The number of tasks exceeds the flow control limit.	Wait for a while and then try again.
400	IMG. 0061	Unknown system error.	Unknown system error.	Contact technical support.
400	IMG. 0062	The image name is incorrect.	The image name is incorrect.	Check whether the image name is valid.
400	IMG. 0063	The VM type does not support image creation.	The ECS type does not support image creation.	Select an ECS that supports image creation.
400	IMG. 0064	Failed to obtain tenant information from IAM.	Failed to obtain tenant information from IAM.	Contact technical support.
400	IMG. 0065	Failed to obtain the tenant domain from IAM.	Failed to obtain the tenant domain from IAM.	Contact technical support.
400	IMG. 0066	The image ID is incorrect.	The image ID is incorrect.	Enter a correct image ID.
400	IMG. 0067	The project ID is incorrect.	The project ID is incorrect.	Enter a correct project ID.
400	IMG. 0068	The specified bucket name is empty.	The specified bucket name is empty.	Check whether the specified bucket name is empty and enter a correct bucket name.
400	IMG. 0069	The specified bucket cannot be accessed.	The specified bucket cannot be accessed.	Contact technical support.
400	IMG. 0070	The image file already exists. Confirm the file in the corresponding directory of the OBS bucket or in the OBS bucket.	The image file already exists.	Check whether the file exists in the corresponding directory of the OBS bucket or in the OBS bucket.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0071	The image cannot be exported.	The image cannot be exported.	Select another image.
400	IMG. 0072	The specified image format is not supported.	The specified image format is not supported.	Check the image format. Only VHD, RAW, ZVHD, and QCOW2 are supported. The default format is VHD.
400	IMG. 0073	The name of the exported file is empty.	The name of the exported file is empty.	Enter a correct file name.
400	IMG. 0074	The file name length exceeds the limit.	The file name length exceeds the limit.	Reduce the length of the file name.
400	IMG. 0075	The file name contains invalid characters.	The file name contains invalid characters.	Ensure that the image file name meets the following requirements: • The name cannot start or end with space. • The name contains 1 to 128 characters. • The name contains the following four types of characters: • Uppercase letters • Lowercase letters • Digits • Special characters, including hyphens (-), periods (.), underscores (_), and space

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0076	You cannot share an image with yourself.	You cannot share an image with yourself.	Do not share images with yourself.
400	IMG. 0077	The public image cannot be exported.	The public image cannot be exported.	Select another image.
400	IMG. 0079	The system disk image created from a charged image cannot be exported.	A system disk image created from a charged image cannot be exported.	Select another image.
400	IMG. 0080	The image created from a CBR backup cannot be exported.	The image created from a CSBS backup cannot be exported.	Export the image after the backup is created.
400	IMG. 0081	The image cannot be exported because it is created from an image file.	The image cannot be exported because it is created from an image file.	Select another image.
400	IMG. 0083	The image is a public image.	The image is a public image.	-
400	IMG. 0084	The image is a private image.	The image is a private image.	-
400	IMG. 0085	The publishing mode is incorrect.	The publishing mode is incorrect.	-
400	IMG. 0086	No image was found.	No image was found.	Check whether the image exists.
400	IMG. 0087	The token is incorrect.	The token is incorrect.	Enter a correct token.
400	IMG. 0088	The number of shared images has reached the maximum allowed.	The number of shared images has reached the quota.	Increase the quota.
400	IMG. 0090	The image being created cannot be deleted.	An image being created cannot be deleted.	Delete the image after the image is created.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG.0092	The image can only be deleted by the owner.	The image can only be deleted by the owner.	Ask the image owner to delete the image.
400	IMG.0094	The public image cannot be deleted.	The public image cannot be deleted.	Do not delete public images.
400	IMG.0095	The KMS key does not exist.	The key does not exist.	Check whether the key exists.
400	IMG.0096	The specified KMS key ID must be different from the image key ID.	The specified KMS key ID must be different from the image key ID.	Check whether the specified KMS key ID is the same as the image key ID.
400	IMG.0097	The key is not enabled.	The key is not enabled.	Enable the key.
400	IMG.0099	You do not have the permission to access the key.	You do not have the permission to access the key.	Check whether you have the permission to access the key.
400	IMG.0100	You do not have OBT permission for KMS.	You do not have OBT permission for KMS.	Check whether you have the OBT permission for KMS.
400	IMG.0101	The original key does not exist.	The original key does not exist.	Check whether the key is valid.
400	IMG.0102	The original key is not enabled.	The original key is not enabled.	Enable the original key.
400	IMG.0103	You do not have the permission to access the original key.	You do not have the permission to access the original key.	Check whether you have the permission to access the key.
400	IMG.0104	Enter the project name if there are multiple projects in the same region.	Enter the project name if there are multiple projects in the same region.	Enter the project name.
400	IMG.0105	The operation is not supported.	The operation is not supported.	Contact technical support.

Status Code	Error Code	Message	Description	Handling Measure
400	IMG. 0106	The image owner is another tenant.	The image owner is another tenant.	Confirm the image owner.
400	IMG. 0108	The tenant ID was not found in the current region.	The tenant ID was not found in the current region.	Contact technical support.
400	IMG. 0109	The bucket name contains invalid characters.	The bucket name contains invalid characters.	Check whether the bucket name is valid.
400	IMG. 0110	The system disk is unavailable and cannot be used to create images.	The system disk is unavailable and cannot be used to create images.	Create an image when the system disk is available.
400	IMG. 0111	The size of the system disk exceeds the maximum allowed.	The size of the system disk exceeds the maximum allowed.	Ensure that the ECS system disk size is greater than or equal to the system disk size of the image and smaller than 1024 GB.
400	IMG. 0112	Failed to add the tenant.	Failed to add the tenant.	Contact technical support.

C Change History

Released On	Description
2023-02-13	This issue is the seventh official release. Modified the following content: ● Deleted **is_config_init** from the example request in **Creating an Image**. ● Added the **sub_jobs_result** and **sub_jobs_list** response parameters in **Asynchronous Job Query**. ● Modified **disk_format** description in **Querying Images**, **Querying Images (Native OpenStack API)**, **Querying Image Details (Native OpenStack API)**, and **Image Attributes**. ● Added error codes IMG.0161, IMG.0162, IMG.0163, IMG.0164, IMG.0212, IMG.0238, IMG.0239, IMG.0241, IMG.0242, and IMG.1075 in **Error Codes**. ● Added the response parameter **properties** in **Creating Image Metadata (Native OpenStack API)**. ● Added details about the values **hss** and **ces** as well as constraints on **hss** in **Updating Image Information (Native OpenStack API)**. ● Changed the return value indicating a normal state to **300** in **Querying API Versions (Native OpenStack API)** and **Querying an API Version (Native OpenStack API)**. ● Changed Redhat to Red Hat in **Querying Images**, **Updating Image Information**, **Creating an Image**, **Querying Images (Native OpenStack API)**, **Querying Image Details (Native OpenStack API)**, and **Updating Image Information (Native OpenStack API)**.

Released On	Description
2021-11-15	This issue is the sixth official release. Modified the following content: • Optimized the description for creating an image in **Creating an Image**.
2021-07-31	This issue is the fifth official release. Added the following content: • **Introduction**
2021-06-30	This issue is the fourth official release. Modified the following content: • Added the methods of querying OBS bucket names and OBS bucket object names in the description of the **image_url** parameter in **Creating an Image**.
2021-04-15	This issue is the third official release. • Added image encryption.
2021-01-18	This issue is the second official release. Added the following content: **Examples**
2020-02-26	This issue is the first official release.
